Hello Steve!

The MPEG decoding core may be obtained for free from
www.opencores.org, so that's the one we'll be using. =)

From: KEN KOSUT <rolem@shell.voyager.net>
Date: Tue, 1 Apr 2003 21:22:27 -0600

>> You must use an IConnect-compatible Telnet client with an IConnect
>> connection

>I can't imagine this not being compatabile.
>This all came as a package from System Solutions.
>I have Telnet Client for IConnect T2

Sure. I don't know where I got the impression that you were trying to use
a STiNG Telnet client from!

>> Teli is the IConnect Telnet client.
>
>Yes, the better one. I checked the site.
>You have to have a program called KEYTAB.
>
>I am using Keytbl. (I don't know if it is the same one)

They aren't, but it isn't really of consequence here TBH.

>I don't really want to make things more complicated than they

In which case the Telnet client supplied with CAB should be ideal.

>> >start CAB.
>> >Open local...Telnet.TTP
>>
>> The Open local menu item is only for loading HTML files!
>
>Then why does it work?

It doesn't really work properly - I think that this Telnet client is meant
to be run from the desktop only as it needs to run in the VT52 window to
keep screen output tidy. That window didn't open when I tried it out just
now.

Don't get bogged down with the differences between "Parameter" and
"Command line" as there aren't any. Both are expecting you to type the URL
of the server you're trying to connect to.

>You can set Telnet up as an Internet Client in CAB.
>But you can't boot it with out the Command Line.

See above.

>So do I have to Install Application in MAGIC?
>(Telnet.TTP)

No, not at all necessary.

>One other thing:
>ETCPATH must be set correctly.

By selecting your ETC folder in IConf you've done that :-)

>You select the ETC folder with the file selector.
>(Unless you have a system wide ETC folder set up using an
>environmental variable.) - I don't understand what this means.

It's a useful method of directing programs to common variables and such.
Theres at least one already set in your magx.inf file, for your User folder
for example.

>Where would the system wide folder reside, and what would it be called?

There's no folder, just that inf file.

>The default was set to Environmental Variable ETCPATH
>However I have no idea where this folder is, or if it even exists!

ETCPATH is entered as an environmental setting in magx.inf, it points to
your ETC folder something like this:

#_ENV ETCPATH=I:\PPP1_8\ETC\

But don't get bogged down, you're fine with what you have. Might be worth
going into IConf and reselecting the ETC folder and resaving again though.

So to recap:

Run it from the desktop, enter the URL into the line, VT52 window opens,
off you go. Hopefully! I haven't been able to get Teli to work for some
reason, it sits with an input prompt but won't let me type anything to log
in. I'm using an ethernet connection with MagNet and its IConnect gateway,
so maybe that's something to do with it.

Cheers

Derryck

Memory card drive -- SCSI readers have existed for years. You could
also use the internal IDE bus of your Falcon

USB -- 12Mb/sec (USB1) is too fast for the Falcon to handle. The USB
specs allow for a 1.5Mb/sec sub-channel for low speed devices, and it
might be possible to get this to work for keyboards, printers, modems,
and mice. Drivers would be an issue though.

WebCam -- this was actually done for the old parallel port webcams
(see http://john.diot.free.fr/atari/). You can also use screen
captures from a standard video camera
(http://members.home.nl/homeboy/falcon.html#vd). None of these are
still in production.

So, to answer your question: If you want a memory card drive, buy
one. If you want USB, you'll have to wait (though a dual USB/PS2
keyboard/mouse with an Eiffel might work). If you want a WebCam,
you'll have to hunt Ebay (hmmm, there's 4 available right now
(http://search.ebay.com/search/search.dll?cgiurl=http%3A%2F%2Fcgi.ebay.com%2Fws%2F&krd=1&from=R8&MfcISAPICommand=GetResult&ht=1&SortProperty=MetaEndSort&query=Connectix+QUICKCAM+COLOR+PARALLEL),
I might get one myself!).

Hey thanks Galen. Currently my falcon is 4 megs and supposedly a 80
meg stock drive. I have i think 250 meg hard drive (scsi)but
accidently put a wrong power plug so it fried it. I just hope to use
my Falcon again since it is my fault of screwing it up. Right now I
still have with me. I am looking at ways to use it and at least keep
up-to-date with current technology or real world use.

So now, online and checking what is going on around especially the
Europeans side since majority is being develope hardware and software.
Like Coldfire and with ct 60 being develope, I just have to keep close
eye with Atari community and maybe get involve or invest. SOmeday get
that company pursuing more of it than keeping the name. Hopefully
Atari image could be more just a video game interests, but give
customers a choice of easy to use and fun muli-media experience
computer, home and business.

If anything just let me know what's up because I just hope Atari would
keep tradional and new technology. I think Atari could compete and
give consumers personal selections other than comparing Apple and
PC(microsoft/ibm).

But just a dream and sometimes i do think Atari can give selections of
personal computer for different people not just apples and oranges
(IBM) perhaps a mango (atari).

> Don't get bogged down with the differences between "Parameter" and
> "Command line" as there aren't any. Both are expecting you to type the URL
> of the server you're trying to connect to.

Yes, but when I type the URL in the "Parameter" it goes into the
VT52 window and displays the first two lines of the Program.
(Program info and Copyright)
Then it freezes. And I have to reboot.

When I type the same URL in the "Command line" it goes to the VT52
window, displays the first two lines of the Program plus:

resolving host
IP
Port:23
Connected.

Login:

Which is the way it is suppose to work!
At this time I type my Login, but it is so slow.....

I looked at an old ST manual, under Install Application.
When selecting Open Appliction, the "Parameter Window" comes up.
The manual says: Type in the filename(s) or other Paramaters the
program expects.
I'm thinking that I should Install the Application (Telnet.TTP)
Create an ASCII text file which contains the name of my URL,
and type that file name in, when the "Parameter" dialog comes up.

Thanks for your help,

ken

There's all kinds of reasons why programs crash. Auto folder conflicts,
accessory conflicts, insuffient memory, and so on.

>When I type the same URL in the "Command line" it goes to the VT52
>window, displays the first two lines of the Program plus:

[...]

>Which is the way it is suppose to work!
>At this time I type my Login, but it is so slow.....

You mean that operating the program like this (ie from the desktop) is too
slow, or that output from the program is too slow? If you're thinking that
you can automate the login process as well you won't be able to do that like
this, if at all.

>I'm thinking that I should Install the Application (Telnet.TTP)

I've just tried this with jinnee, where all you have to do is to enter the
URL into the parameter box and it connects straight away when you double-
click the TTP. I can't see why this can't be done with MagxDesk also, but it

seems to use a rather over-complex and less than obvious method.

>>Create an ASCII text file which contains the name of my URL,
>>and type that file name in, when the "Parameter" dialog comes up.

I also tried creating a text file containing the URL. I dragged it and the
TTP to the desktop (to make them easy to access), and then dragged and
dropped the text file to the TTP - which ran and opened the URL. I couldn't
get this to work with MagxDesk though, but my system isn't set up to use it.

I think that you need to get a copy of Alexander Clauss' AVServer program
and install that (and specify it as your AV server in the Magx.inf file)

#_ENV AVSERVER=AVSERVER

Or whatever its docs say should be entered.

Cheers

Derryck

Hi... I have my PC at uni, which is very far away in the wilds of Scotland, whilst I sometimes pop back home to south east england to see friends/family etc. I have an aging 1MB STFM sitting back there, that I sometimes use to type up work if need be (using Protext 4.3...). Having not followed the state of atari that much as of the past few years; is it possible for me to access a pop3 and or web-based email account (ie hotmail), using my atari? I don't need to access attachments, but the ability to send and receive email whilst connected to a PPP connection would be great; as would telnet / simple web access - again this doesn't even have to be proper graphical HTML, a unix style lynx browser would be fine. At home i'd have a standard BT Internet PPP dialup connection, and my atari ST has 2 double sided floppy drives, and a standard external modem... Anyone got it to work with a spec like this?

Cheers,

Dave.

You won't find one that will... there isn't an Atari powerful enough to
emulate a C64, at least not well enough to be able to play games.

1757. Re: Converting regular ST .zip file to ST disk image?

Newsgroup: comp.sys.atari.st
Date: 2003-04-04 23:45:55 UTC
From: "Edward S. Baiz Jr." <edbaizjr@attbi.com>
Message-ID: <3e8dc4627ba782@attbi.com>
Source record: 28439

>Let me put this way:
>
>If I have an ST game disk (whatever format, tracks I use back in the early
>days), is it possible to convert them into a diskimage format (.st or .msa)
>for STeem?

If STeem uses disks with ST or MSA extensions, then the answer is
yes.

>(does that mean I have to insert ST floppy in the PC drive or in the ST drive
>for conversion process??)

For MSA conversion the disk would have to go into a ST.

>How about the opposite direction - from .ST or .MSA disk image into a regular
>ST disk floppy that I can insert in ST drive on a real ST computer?

You would first convert the ST file into a MSA file on the PC,
then copy the MSA file to a ST hard drive and then convert it onto
disk (in the ST floppy drive)

>Is there any emulator that can read and execute ST binary, games? (unlike the
>disk image that emulators use- just curious)

I am pretty sure that PacifiST uses ST image disks....

If you are talking about a ST, I bought a piece of hardware that
gives the ST access to a network using Cat-5 cable. I have a STe,
Hades and a PC connected to a router than goes to the Internet.
Works quite well....

Yes it is possible, but more memory (2 or 4meg) would be better. I
would go with STiK2 or STing and use Newsie. It allows email, ftp,
newgroup access and even has a text-based web browser.

Hello all,

I finally got it all working. I had to make sure both computers were running BNet. I used the STing version on the STe and installed BNet as an accessary. I used the MagicNet/Mint version on the Hades. Now I can bring up the STe's files on my Hades desktop and (to my surprise) bring up the Hades files on my STe desktop. Transfering files is now a snap. I am going to setup Newsie on the STe and use it as a backup for Internet access just incase something happens to the Hades. I will also back up the STe's hard drive onto a CD using CDISO running on the Hades.. Great program.... Thanks Vassilis......

Nelly,
As long as it is an External SERIAL modem with D-
type connector, it should work. Is there anyway that
you can salvage the cable?? If not you should be able
to get one from most computer shops or JDR or some
other retail place that sells multiple kinds of
connectors or cables for around 10 to 20 dollars. If
you want help setting up STING on an Atari system just
e-mail me at firest@williams-net.com and I would be
glad to help as I have setup STING multiple times on
my 1040STf and even on my Falcon for occasional usage
with Atari ICQ. Which STING is not needed to use
Atari ICQ anymore.

Thanks,
Carey Christenson

Hi Derryck,

I mean operating the program from within CAB is too slow.
I can barely type any user/password characters at the login:

I do not wish to automate, but run from the desktop.

> >I'm thinking that I should Install the Application (Telnet.TTP)
>

Thanks for testing.
But in rethinking this problem, maybe the program is not finding
the correct port.
Which puts me back to setting ETCPATH correctly in Iconf.

Try the following:

For disk images for any Atari emulator & for real Atari's if you get a
program to turn them back into real disks:

http://www.atari.st/
http://atari.krang.net/

For a real Atari (just download and run):
http://www.atariuptodate.de/ (in German - Spiele means games, the rest
is pretty easy to figure out, I think)
ftp://193.190.204.128/
http://launchpad.atari.org/ (Go to the "Software" link)
http://www.atari.org/ (go to the "ST" QuickLink, where you'll see a
"Games" link)
http://www.umich.edu/~archive/atari/

These are just a few that I easily found through a simple internet search
engine (Google to be specific) as well as a couple I knew of off the top of
my head. At some of these sites you'll find a number of other links as well.
Good hunting, and have fun!

On Sat, 29 Mar 2003, MStepansky wrote:-

>Let me put this way:
>
>If I have an ST game disk (whatever format, tracks I use back in the early
>days), is it possible to convert them into a diskimage format (.st or .msa)
>for STeem?

If it is copy-protected, no. Otherwise, yes.

>(does that mean I have to insert ST floppy in the PC drive or in the ST drive
>for conversion process??)

That could depend on the PC[0]. If it's running WinME, or later, MAKEDISK.EXE won't work[1]. DOS, Win95 and Win98 work fine though. If you've access to a Linux machine, that'll work as well[2]. Using an ST is virtually guaranteed to work.

>How about the opposite direction - from .ST or .MSA disk image into a regular
>ST disk floppy that I can insert in ST drive on a real ST computer?

As above, although you'll probably need to convert a .MSA to a .ST beforehand.

>Is there any emulator that can read and execute ST binary, games? (unlike the
>disk image that emulators use- just curious)

PacifiST had some limited support for directly reading the floppy, as did TOSBox. I don't think WinSTon, STeem or Aranym do.

[0] I've have a motherboard that have had a difficulty in reading extended format discs. It was so bad it wouldn't even read an 80x10x2 disc. Updating the BIOS didn't sort out that problem and it only went away when I replaced it.

[1] Personal experience with WinME trying to make a few disc images resulted in files the correct size containing nothing but zero bytes. The same discs were read properly under Win98. AFAIK, it's because WinME, and later, blocks direct access to the hardware.

[2] <mode type="techy"> Not having an ST, I use script that reads the disc using dd and mounts the image as a loop-back device. Makes for checking the contents, or adding/deleting stuff, easier[3].</mode>

[3] This was how I finished doing the shareware disc images for Frontier, temporarily available at:

<URL:http://www.my-ste.demon.co.uk/frontier/index.htm>

You looking for trouble? Well if you persist in this course of action, you
WILL find it, I promise. THEN you will find out how much I know, and how
easy I can find you in real life. Thinking about hiding behind a so-called
anonymous IP address? ha ha think again.

Just in case you have to ask... YES this is a threat. Leave me alone or face
the consequences.

Just a little over the top, don't you think? The comment may have been a
little rude (whether it was justified or not), but not *THAT* rude. This is
just the kind of reaction and overreaction (both this and the post that this
is in response to) that screws things up for the rest of us here. I want to
read calm discussions and every once in a while the occasional heated (but
constructive) debate, not this kind of crap. Say what you want to say, agree
or disagree with people, but for the sake of everyone here, do it with a
little more grace and civility, ok? If there's something you want to resolve
or fight about, take it to personal e-mail.

1787. ARAnyM Demo CD app contents questionary

Newsgroup: comp.sys.atari.st
Date: 2003-04-05 19:41:00 UTC
From: Petr Stehlik <pstehlik@sophics.cz>
Message-ID: <pan.2003.04.05.19.41.00.411304@sophics.cz>
Source record: 28368

Hi,

I have just got the ARAnyM Demo CD working and now I am wondering what cool MiNT/GEM applications I should put there to show the true power of ARAnyM. I thought a decent video player should be there (we got nothing but Aniplayer - is it free for including on a CD like this one?). Also probably MP3 player, perhaps some benchmarking (which ones? Certainly not GEMBench) and demo programs (GEM Demo?) Maybe also some games (Doom? Quake? Duke Nukem 3D? Patrice, are you going to port that? :-).

What else should be there? Do we have some CPU hungry applications that would run happily on ARAnyM AFROS? Or some apps that enjoy large and fast gfx? I don't want to put there GCC and 'time make freemint'. I think that the application developers already realized the strengths of ARAnyM in this respect so I'd focus this ARAnyM Demo CD for regular TOS/GEM users...

BTW, this CD could also 'promote' other free software in development. Say I'd put there HighWire as the HTML viewer?

Any suggestions? BTW, please keep in mind that all software I'll put on the CD must be free..

Perhaps a clone would be fast enough. For example Atari800 (http://atari800.atari.org/) runs on ARAnyM (http://aranym.atari.org/) at full speed. And I think Atari800 is the most complicated 8-bit machine to emulate accurately. So 100% emulation of C64 at full speed should definitely be possible.

Mind your own business. Or at least do some reading.

1790. JVC SC1224 monitor and low Sound volume on 1040STF!??

Newsgroup: comp.sys.atari.st
Date: 2003-04-06 00:37:01 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <v8utl8tmakqj65@corp.supernews.com>
Source record: 28371

I have a 1040ST and I have three Color Monitors. One is a common SC1224, and 2 are the rarer JVC SC1224's. The Comon one plays sound nice and loud as expected. On the JVC's the sound is real low even with the sound voume all the way up! I have 2 different monitor cables and they both do the same thing. Either this is how it is with these JVCs or my ST is being weird!

On Mon, 31 Mar 2003, Smeg wrote:-

<snip>

You forgot to mention HSMODEM, or a similar patch, is required
especially when using the serial port at high speed (definitely 19200
and probably 9600 bps) to avoid bugs in almost all versions of TOS.

>Plug it into the ST's modem port and power it up.

Since the OP was using a PC, they can do the same tests using that. All
they'd need to do is plug it in and have Windows detect the modem. If it
fails to work under Windows, it's almost guaranteed that it'll fail to
work on an Atari.

<Snip how to test>

>Once you know your modem works you can concentrate on getting it on the net.
>
>Someone else take it from here, cos I dont know Sting/Stik etc.

Since the OP is using Freeserve, and if they haven't screwed things up
since I used them, it should be possible to connect an Atari to them as
long as Sting/Stik is configured to use PAP.

Regards,
David Bolt

Hi Derryck,

> You've seen Pascal's correction for the author of AV Server?

Yes. Thanks, both of you, for your suggestions.

I almost got it (Telnet.TTP) to connect by typing in the IP
address in the Parameter Box.
This time it got as far as Port 23, but would not connect.

Do you know how I can separate two commands.
In other words, I'd like to type the host followed by the IP address.
(without it being strung together as one command)

Thanks again.

Hi,

The SCC interrupt is fixed, now I can use again the net under my Falcon,
Newsie & CAB works.

Hardware problems to fix:
DSP interrupt.
SCSI, DMA sound, BLITTER: arbitration ?
Clock with the motherboard (20 Mhz and differents clock patchs) ?

Something like the end of this "Never Ending Story" :-)

Regards,

Didier.

Hi all

Thanks goes to Robert Bouwhuys for creating an HTML version of the MT Pro
Manual. It is available on my newly redone (mostly correcting mistakes:-)Master Tracks Pro page:

http://tamw.atari-users.net/mtpro.htm

Go to the links section to view the manual. The table of contents have hyperlinks to the various sections of the manual. The manual is 266K however, so wait for it to download. If you want to save it to your hard-drive, simply right click and "save target as" (for PC users)

Thanks Robert for a job well done.!!

Now is also your chance to check out Master Tracks Pro, an excellent sequencer

An impressive amount of vintage hardware!!, it makes me drool, I have been watching all this infighting and was unaware that you must use an Atari to post on here, just checking I find only about 1 in 50 mails come from Atari's??, so I guess I must move on and unsubscribe as I wouldn't have the time to set up my old STE and buy a modem but it has been nice to reminisce about all the great times I had with this old gear so goodbye and sorry I could not meet the requirements of this group

Hi Sabrina,
The only stipulation I know of (general rule of thumb) regarding
posting to this group is that the post should be Atari related !!!

Yes. There is a new improved version by Mark Feaver on my download
page

http://tamw.atari-users.net/dwnloads.htm

Look for it...it is there. (you might find other programs of interest
as well)

It works in LOW resolution which is unusual for a MIDI program, but it
is quite unique.

Does the STe have the 40 pins for IDE like the Falcon does? On the latter machine, it's simply matter of plugging in a cable.

No, STe does not have it.

You can buy an interface for it, or build one yourself (sorry, I do not remeber url< just google).

I got some virus on my boot sectors and I used a prg called: VirusDie.
Cool little prg and it found virus. But I think it wipped out all the boot
blocks as those bootblock warning are gone and I stupidly did my original
Goldrunner disk! Now the game will not boot!!!!

Does anyone have a copy of this game that is not on a menu disk? Just the
game itself? Email me if you do maybe I can at least salvage my original
disk... :(

>I almost got it (Telnet.TTP) to connect by typing in the IP
>address in the Parameter Box.
>This time it got as far as Port 23, but would not connect.

If all your other clients work, CAB, email, news, ftp work then I can only assume that you're trying to telnet to a server that won't accept such connections, or that you are trying to telnet to something like a mail server etc that is set to refuse connections to port 23.

That doesn't sound exactly the same problem you have, but I can't think of anything else.

>Do you know how I can separate two commands.
>In other words, I'd like to type the host followed by the IP address.

You telnet to the actual host name (for example cix.co.uk) or to its IP address (194.153.0.53), you don't enter them both. If you enter the actual name, then your ISP converts to the dotted quad address using its domain name server.

If you try to telnet to my example, CiX will recognize that you are trying to telnet into its conferencing service, and will ask you for a login.

Cheers

Derryck

> > it claims to be an IDE driver.
> >
> > does anyone have any more information on this?
> >
> > information on how to program the GAL would be extremely useful.

This is not driver, but interface. Driver is here:
http://members.tripod.com/~piters/atari/astide.htm
Driver is made specific for work with PC formatted partitions. If it's not
good for you, try to get Uwe Seimet's driver. I don't know is it free...

For programming GAL you need programmer device. So, it would be best if you
find some electronic who has it, and he can programm GAL with given content.

Cheers, PP

Go to www.uvk2000.com. Download the "Ultimate Virus Killer". That is a
good virus killer. On top of being able to kill viruses, it can also put
back your Goldrunner bootsector. Use the 'restore bootsector' option.
Goldrunner is a super cool game, so I hope you will be able to play it again
some.
Throw away VirusDie.

Hello Everyone,
I am getting cable modem tommorrow and will be going
to a friends house to setup my Linksys 4 port ROUTER.
I was wondering what the verdict is on running STING
or MagicNet for Lyndon Amsdon's EtherNEC card
device??? I have both STING 1.26 and MagicNet 1.3.9b
which I believe are the latest versions. If not,
please let me know where I can get the latest version
and what the current version number is up to. I would
also like to find a URL that shows how to install
Magicnet or STING for internet access. Thanks for the
help in advance.

Thanks,
Carey Christenson

From: Luposian <luposian@lycos.com>
Message-ID: <3e91efee$1_7@corp.newsgroups.com>
Source record: 28209

Has anyone yet tried to create a "Micro ST" by putting an ST emulatior into a Lattice PLGD chip (or whatever it's called)? What would be the most reliable emulator to use? Certain companies seem to gain great joy by recreating the Atari 2600 in these tiny joysticks or controllers you plug into your TV and selling them. Why not the Atari ST? If for nothing but gaming! "The STGS" (ST Game System). It goes without saying that ST games are FAR more advanced than Atari 2600 games are. And why hasn't a company done Lynx and Jaguar retro games?

Luposian

Well, well, guess what's in my Mega 4 here????? LOL

Does your friend know the board can be hardwired to a switch to turn it on and off as required?

I'll print your message out and put it by the Mega 4, and see what I can find in the diskettes for it.

I don't know why you want to trade a several hundred dollar
Wizztronics rack case for a <$100 power supply, but I have one if you
wish to make the trade.

It is possible. You won't likely be able to access web based mail due
to the ST's inabiltity to easily deal with security (i.e. encryption).
However, POP3 over PPP is possible. You will need STing or STiK and
an email program (Marijuana Mail is the smallest and probably the only
one you can get running on a single floppy 1 MB ST). Since you have
two floppy drives, you might prefer Newsie, which has very good
(though slightly buggy) newsgroup capability and Lynx-like HTML
capability.

Actually, what I'd like to do is "generic-ize" and modernize an Atari 1040ST's design. What I mean is, make the 1040ST from totally off-the-shelf parts, and then make a few design changes to make it the way it SHOULD have been made!

The MC68000 can address up to 16Mb of RAM. The 1040ST never could, thanks to a crippled MMU. Why? The Video Shifter chip is custom, I believe, but only allows 16 colors out of 512. Software hacking gets around this problem, but... why? Slap a better video processing chip in the thing. The 1040ST had a low res of 320x200x16 colors... why? That's 4-bit video! Gah! 640x480x256 colors was doable with 256K of DRAM. Gee, we had to wait for the Falcon030 to get that! Maybe the TT had it, don't recall.

The ST could, I believe, be "redone" with fewer/better/smaller components, making it the best it could be. Give it four or eight 30-pin SIMM slots so that it can address all 16Mb of RAM! Give it a normal MMU! Give it a non-limited video chip! Give it USB ports! A standard VGA port! Audio out!

NOW we'd have an ST that is all that it can be... and then we go and take that and couple it with CP/Millenium-68K (modernized version of CP/M-68K and design a new GUI for it! Or start out with a nice multi-tasking OS like Minix (something based on a BSD-license or similar) Who says it has to be ST compatible? Start over! Start fresh! And finish FIRST! Naturally, we'd have an emulator for those few components the new ST didn't have, like that crippled MMU and crappy video shifter, TOS/GEM, and such... but the new software would run on a better ST than ever before!

Sigh... I need to go to bed... I'm pipe-dreaming and pointlessly emotionally torturing myself again!

Hi Luposian,

That idea has crossed my mind too. A "modernized" ST. However, I was more thinking of a 99.9% compatible ST than a souped-up ST. If I wanted that, I'd just get an ACP computer when it comes out (or search for a Hades/Milan).

My idea of a MicroST would be a clone of a smaller MegaST4 with TOS 1.0 and 2.06, built-in IDE and SCSI ports (lose the ACSI port), standard VGA mono and color port, native ST resolutions (plus more if compatibility remains the same) and more RAM (again, if compatibility can be maintained). I'm kind of iffy about STe compatibility because there really isn't a lot of software that takes advantage of the extra features. The only reason why I think people recommend it more is because it can be easily upgraded to 4MB.

As you can see, my design is more of a balanced machine for gamers and productivity people. But, hey, we can dream... :-) ...zzzz....

You want ST or what? If you want better specs - buy/make a better Atari.

Moreover, fitting more than 4MB of memory is a bad idea: many games and
demos depend on the fact that ST cannot have more than 4MB (well, in fact
there are expansions up to 12MB), and those games/demos would not work (it
is the one of the main reasons of not full compatibility of TT and Falcon
with ST).

> I am getting cable modem tommorrow and will be going
>to a friends house to setup my Linksys 4 port ROUTER.

I have the self-same router, and it works very well with my Falcon. As
you obviously already know, you need a Java-enabled browser to set it up.

You must remember to set fixed IP addresses for Ataris, and about the
only issue I've found is that I can't get telnet to work. I haven't
bothered to track down where the problem lies as I never use it, but
possibly I need to set port forwarding in the router(?).

>I was wondering what the verdict is on running STING
>or MagicNet for Lyndon Amsdon's EtherNEC card

I'm using the Genius parallel port Ethernet card with a ROM port adaptor
under MagxNet, IConnect and GlueSTiK gateways. Which stack you choose
must be influenced by what is available for your interface and what
clients you want to run under it.

>device??? I have both STING 1.26 and MagicNet 1.3.9b
>which I believe are the latest versions. If not,
>please let me know where I can get the latest version

I'd have thought that the respective authors' web sites would be the best
places to look ;-)

I was hearing about a recent beta release of MagxNet in here a few weeks
ago, maybe you should email Vassilis to ask.

>I would
>also like to find a URL that shows how to install
>Magicnet or STING for internet access.

I can't recall the exact sequence of events I carried out, but if *I* can
do it... :-)

I'd say the biggest problem is the scattering of folders and files which
can make tracking down where to make changes a little confusing.

HTH.

Cheers

Derryck

I think you are talking about FPGA chips? Well super videl is being built
around one of these (http://supervidel.atari.org).
This is a very good idea, and as I am going into FPGA programming I am
wondering why I didnt think of it myself ;)
The problems I see are emulating the Glue and maybe the MMU - for maximum
game compatibility these must function exactly like the old ones. I think an
FPGA may be fast enough, but if not it could be possible to use 2 devices,
but then cost goes up and the financial viability of the project goes down
(seeing as you can pick up an ST from between free-£30 anyway). Also lot of
games (most?) rely on having a keyboard for certain functions. You need to
have some sort of keyboard emulator with an extra set of say 10 buttons on
the stick that can be set to send particular keypresses (sets saved for each
game of course).

How are the games supplied to the emulator? They could be floppy based but
then there is loading delay and extra cost and size of the emulator. I would
probably suggest some sort of USB link, where you can use your PC/MAC to
transfer games of your choice in .ST/MSA/RAW image format and put them into
a large nvram (indeed the 4meg st ram could be made NV for suspend/resume
function).

Well this is certainly possible to do, but if your expecting something like
the N64 look alike controllers loaded with 2600 games then you may be
dissapointed. The ST/E is gonna be exponentially more complicated,
reflecting in size and cost.

1845. Re: Atari ST on a chip...

Newsgroup: comp.sys.atari.st
Date: 2003-04-08 17:28:56 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <3e930703$1_7@corp.newsgroups.com>
Source record: 28226

In an ST emulator (for example, "STonX"), aren't all the "pieces" (chips) of an ST accounted for, including the Glue and MMU? Is there a 100% compatible emulator available? If so, why not just take the parts of the emulator that involve the custom chips (Glue, MMU, Video Shifter) of the ST and put them into the CPLD? Then create a more modern ST around it. When code (game, demo, or application) requires a specific part of hardware that the new hardware doesn't satisfy, it triggers the CPLD emulator.

Much like the Power Macintosh 6100/60 had a 68040-based Mac emulator inside of it (99.99% seamless, as I recall, just a tad slower than a real 68040-based Mac), why can't ST emulation with new hardware be accomplished?

I think youre forgetting that you cant just move the object code from the emulator to the CPLD or FPGA or whatever. These things have thier own language and any existing code must be ported and most of it would have to be re-written. Also, an FPGA doesnt have the inner workings of a PC, you would have to emulate parts of the atari that you dont need to on the PC based emulator.

I think the first thing that would need to be done is to write the cpu emulator on an FPGA (I think the native compiler is C based) and make sure it works fast enough to give you the power of a 8mhz 68000.

1848. Highwire dev

Newsgroup: comp.sys.atari.st
Date: 2003-04-08 22:46:37 UTC
From: lp <gfa@basic.net>
Message-ID: <BAB8BB7D.F016%gfa@basic.net>
Source record: 28229

Hi all,

I just read a rumor on some site that highwire dev might have stopped. I will refer to that as a rumor since it is false, like most rumors. In fact I recently tested a binary with new features since the last release. Please don't ask me about it, I will not give out details. Suffice it to say the project is always being worked on even if the mailing list has no traffic. There will be more releases, a browser does not happen by accident, as it takes planning and time.

Maybe I should assume GIM is dead because the status page reads:
GIM - GEM Instant Messenger
Last Updated: Sunday September 22nd, 2002

Last year, hmm... I've never seen a binary either. ;o)))

From what I recall, the Stacy was not setup to do bi-directional, and Atari had a bit of a bastardized parallel port. Make sure that the cable you're using takes advantage of all the pins in the parallel port, and you should be ok using a generic HP printer driver, depending on the application you're trying to print with.

Others have given you excellent advice, you do need to get the hard disk driver to get the system to acknowledge the hard drive is there.

One other point to check is the bottom of the megafile should have some adjustment points...what's the word I'm looking for??? Dip Switches??? There will be three little white switches there that will set the device ID on the megafile. Be sure that it is set at device 0.

Hello,

> >I almost got it (Telnet.TTP) to connect by typing in the IP
> >address in the Parameter Box.
> >This time it got as far as Port 23, but would not connect.
>
> If all your other clients work, CAB, email, news, ftp work then I can

CAB works. The only other clients that I have are Telnet and Fiffi.
I have no email or news clients. That's the problem.

> only assume that you're trying to telnet to a server that won't accept
> such connections, or that you are trying to telnet to something like a
> mail server etc that is set to refuse connections to port 23.

I am trying to Telnet to a mail server. My ISP says this is possible.
But after further examination of Telnet DOCS, it isn't going to
matter anyway. It is compatible with ELM which is not on my server.
So I am going to stop wasting phone calls by trying to Telnet.

What is the difference between Emailer 2.3 and Emailer 2.3f?
Does this run with Iconnect 1.5 or do you have to get Iconnect 1.8?
Is there an English .RSC file for this program?

> >Do you know how I can separate two commands.
> >In other words, I'd like to type the host followed by the IP address.
>
> You telnet to the actual host name (for example cix.co.uk) or to its IP
> address (194.153.0.53), you don't enter them both. If you enter the
> actual name, then your ISP converts to the dotted quad address using its
> domain name server.

Yes, Ideally this is the way it is suppose to work.
I typed Host (space) IP address and it got as far as Port 23.
If I just type Host, it doesn't even get to Port 23.

And if I awkwardly run it through CAB it does Connect.
But I can't type anything at the Login prompt.

It also seems that ETCPATH must be set.
In other words ETC/SERVICES
Seems like the Services folder is very important.
(additional editing may be necessary)

Thanks again,

ken

1858. STe Simm Chips

Newsgroup: comp.sys.atari.st
Date: 2003-04-09 08:23:57 UTC
From: notfor@publication.com
Message-ID: <3e93d953$0$16255$afc38c87@news.optusnet.com.au>
Source record: 28239

One or two of my STe(1040) SIMM chips (2x1MB) died, so
I've just tried using 4x1MB simms from an ancient 386 PC
and they appear to work!! I did 3 runs of 'Memcheck.prg'
with no errors evident. I still find it difficult to believe that
such SIMMs should be 100% compatible. Is anyone
using similar?

Cheers
Mike

All my Ste s have old PC chips in them. I did have to do a bit of swapping around to get them all working (it works best if you have ones from the same manufactures in pairs, if you see what I mean) , and you have to watch the access time of the SIMMS, but they work fine. Lots of people use/used these SIMS in STes.

All should be fine, a simm is a simm is a simm. As long as it is better than 120ns access. This is denoted by the -12 after the numbers on the chip. Just add a 0 to whatever your chips indicate. i.e. -6 is 60ns and -8 is 80ns. The lower the number the better. Are you related to our glorious P.M. in Australia "John Howard"?

Does this mean that youre gonna stop sending virus laden emails to me????

You must think i'm stupid if you thought I wouldnt know who it was, I have worked for major ISP's and a large AV company.....

Good bye and good riddance.

These little triumphs are what made the whole 'bootsector restore' option
worth including. You're welcome, Tim.
I trust you've already thrown VirusDie away? :-)

There are several that all work about the same. Here is one place
they are for sale: http://www.1632-sales.zenwebhosting.com/acatalog/index.html?http%3A//ww
w.1632-sales.zenwebhosting.com/acatalog/Mario_Becroft_Hardware_Projects.html&CatalogBody

>I have a 2.5" Laptop HD I can use. What sizes can
> these interfaces use?

The interface can use any size. TOS however, is limited to 256MB or
512MB partitions (what version do you have?). Still, 14 256MB
partitions make nearly 2 GB.

Yes. Log on to Zetnet.co.uk, where you will find a small but flourishing
Atari community and an ISP that welcomes Atari users.

Charles.

I have TOS 1.04. I am looking for one for my 1040STf. Is it easy to
install? How can this drive boot. Do I need a boot disk? Or can it
autoboot?

Thanks I am new to the ST, I had a 520ST years ago. Always wanted a 1040ST
and I got one a few years ago in mint condition.

I have been able to transfer most all custom menu disks to DSDD disks with STDISK and MAKEDISK just fine. Must be in DOS mode to do this and not in Winblowz. Question is what kind of ST Copy Prg can I use to copy these disks on the ST itself?

G'Day Mate!! I remember you from 2001 - are you still repairing
Atari's? I've now got 5 of them - 1 dead, 2xSte's & 2 Stfm's. Bought the
last one on EBay for the princely sum of $20. It cost more in postage
than I paid for the computer. Nice to see you're still active and still
helpful (Optus rocks!! - I only wish broadband was cheaper).

Cheers

TOS is limited to partitions of 32 MB!

You need BIGDOS to override it. Then it can be up to 2 GB. With Mint you
can use FAT 32 too...

30-pin SIMMs? How long have you been away?

Even the PS/2 SIMMs we used in the Milan are now heavily outdated (ie. not really available retail except as used parts). Even single-data-rate SDRAM is on the downturn already, though you might still use these for a new design.

When you are done with that design, you will need a heavily reworked TOS and end up with a machine much like the Hades or Milan - maybe more compatible due to the use of a 68000 CPU, but at the price of the speed of a mere 68000.

And as soon as you change the video chip, you loose compatibility with a lot of the applications (ie.: games) that really make such a design useful. For the other, "normal" applications, you can as well use a newer design with a faster CPU, more than 16MB of RAM etc..

Your proposed design might win in "hack value" and be fun to design, but what use would it have? Either use an old, original ST for the games, or a modern machine for the real applications.

None that I know of - IIRC, there is no ST emulator that does a
clock-accurate emulation of the custom chips (like some C64 emulators do
now) - it would be painfully slow.

>involve the custom chips (Glue, MMU, Video Shifter) of the ST and put them
>into the CPLD? Then create a more modern ST around it. When code (game,
>demo, or application) requires a specific part of hardware that the new
>hardware doesn't satisfy, it triggers the CPLD emulator.

That would be slow and not 100% clock-accurate. Games that require the
original hardware will often do stuff where hardware accesses are times with
the CPU clock cycles to get the accesses at exaclty the right time.

Huh? What TOS are you talking about, 1.00?

TOS 4.04 can handle up to 1GB per partition, older versions 512 or 256MB.
IDE means he will need at least TOS 2.06 to boot off the disk, so 32MB is
definitely wrong, although I am not quite sure of the exact limit that 2.06
can handle.

2.06 can handle 32 GB with standard driver. Special driver can allow
bigger partitions.

And it's last TOS for old 'original' Ataris. And thread is about 1040, not
som Medusa...

No, it isn't. Even with TOS 1.02 each TOS compatible partition can have
256 MB. With TOS 2.0x/3.0x it is 512 MB per partition, with TOS 4.0x it
is 1 GB per partition. You do not need any additional tools for that.

32 GB with TOS 2.06? You must be confusing something. No version of TOS
can handle that.

> And it's last TOS for old 'original' Ataris. And thread is about 1040, not
> som Medusa...

Yes, which means that at least 256 MB are possible, as this is what TOS
1.0x supports. See my other posting or Michael's posting for the limits
of other versions of TOS.

I meant this when use Ataris AHDI driver (or what is exact name...).
With drivers which work with big sectors limit is much bigger of course....

Actually, I don't see any sense to attach large drives on Atari 1040 and
similar computers. Except for people who has lot of software for those old
machines and has even bigger nostalgia...
Even in that case, CD is much more suitable media for storage.

I think you are confusing GEM with BGM partitions. GEM partitions are
IBM compatible, and there is indeed a 32 MB limit on those (16 MB on
very early TOSses, if I recall). However, every Atari OS (except
perhaps 1.00) can also have BGM partitions, which work well on Ataris
but are not IBM compatible. Since the commerical IDE adaptor is also
a TOS 2.06 upgrade (I had forgotten about that), the largest partition
available under TOS will be 512MB, and 14 partitions can be active
simultaneously for storage of 7GB. With special drivers, other types
of partitions, like FAT32 (F32) and Linux are possible, but that's
another discussion.

To those of you who E-Mailed me asking me to Ship outside the U.S. or to other Countries? I'm not even willing to Ship within the U.S., let alone other Countries. Too much trouble for free stuff! If someone wants me to do all the work to Ship, you'll need to pay me. Or buy Atari stuff from me and pay Shipping and I'll add the FREE stuff. And no matter how much. It's not worth Shipping outside the U.S. including dealing with Customs Forms! To see the Atari stuff I sell listed, If you want to buy so I can add free Items to your Shipment. Go to my WebSite at http://BensCatalogs.Atari.org

==Text Below has been updated==

I've got some stuff to get rid of. Indus GT, Atari 1050 and 810 Drives for Parts. Surplus Atari 800 Computers, and more Atari stuff. Spring Cleaning. I also have Atari 520ST, 1040STF Computers mainly for parts. Maybe a MegaFile Hard Drive, Miscellaneous Hard Drive, Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor and as a VGA Monitor on a PC. Need to be fixed, Tender Loving Care. And more Atari stuff. I'd rather someones came and picked it up. I DO NOT want to Ship unless I get paid. To much work to Ship! I'm in Portland, Oregon USA. I want someone/someones local to come pick it all up. Rather than ship it. Interested? E-Mail Atari@aracnet.com or I prefer you call Ben at (503)256-9974.

==Thanx==

1903. Memory Upgrade for 1040STfm

Newsgroup: comp.sys.atari.st
Date: 2003-04-11 04:44:32 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <2Lrla.193$Am4.114051@news.abs.net>
Source record: 28335

I have a stock 1MB 1040STfm which I would like to upgrade to 4MB. I know there are a variety of upgrade kits available, but would like to know any opinions on which one is easiest to install and is the most reliable.

Thanks.

Jason Harmon

With AHDI the limits are the same. It's TOS that sets the limit, not the driver. I suggest that you browse old postings (10 years and even older), where all this has already been discussed. Obviously you do not know much about these issues.

OK. Maybe I confused it (I'm on PC for many years now...).
But can you tell me what software have Atari users for partitioning HD and
work with such partitions?
I know about Uwe Seimet's driver and partitoner and some Hushi (if I
remember correct). Both are comercial, and Hushi is not easy to find (no
WEBsite as I know).

As I remember old Atari's AHDI or what is exact name could work only with
partitons up to 32 MB...

This is not only TOS issue, because TOS has not bouilt in HD driver.

I will check it soon. Maybe I don't remember exactly...
And please, without comments. I don't want here some heavy discussions
again...

Believe me, there is at least one driver which sets 32 MB limit :-)
(This is not PC compatible one)

1907. New in at DDP Translations

I have problems with ScanX on my CT2b/Falcon as well. I can get the
program to run but the SCSI drive will lock up. In fact the SCSI drive
locks up in other programs, and copying files. I'm going to try the
SCSI timing mod as described in the CTB2 docs. It will work in non
turbo mode.
Mark

You might try CBHD from Claus Brod / Steffen Engel:

http://home.t-online.de/home/Steffen.Engel/

I have not seen updates for some time, but it should work.

> As I remember old Atari's AHDI or what is exact name could work only with
>partitons up to 32 MB...

Later AHDI versions could handle bigger partitions.

> This is not only TOS issue, because TOS has not bouilt in HD driver.

Partly. What effectively limits the supported partition size is TOS. Of
course you need a harddisk driver that supports such partitions in the first
place.

Such thing is impossible. It is theoretically possible for machine with
512KB of memory, but for bigger ammounts it is impossible.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! Even if one person wanted to take it all, it would take several trips. It's more likely this job will be done by several interested parties. DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money!So, are you Interested? E-Mail Atari@aracnet.com or I prefer you call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

AHDI, for example. No problem with partitions up to 256 MB. 512 may also
work, depending on the version of TOS, of course.

> As I remember old Atari's AHDI or what is exact name could work only with
> partitons up to 32 MB...

That's wrong.

Thanx for this reply (Uwe Seimet doesn't bothers with some explanations.
What he says is so, and period! :-)).

Anyway, I was at least partially in right. Because I don't see where I can
get AHDI, newer version.
It's real nonsense and shame that such old and outdated software is still
under copyright, what I would rather call selfish behavior.
It's sure that nobody has any belief of that this software is not easy
available. If available at all.

And of course there is always possible to override TOS limitations with
some software. (But it will not happen in Atari case.)

I started before some 2 years to write GUI program for HD partitioning,
but abandoned in early stage because of little interesting, and bad
situation in Atari community. It should be similar to Partition Magic, but

simple, only for partitioning. Too late for it. Before 10-15 years it would be very useful.

Hm, should not be to hard to find actually. Just made a quick check and
ahdi6061.lszh driver and hdx504.tos is ready for download at:

ftp://ftp.cs.tu-berlin.de/pub/atari/

Hi folks.

Can anyone tell me if the Epson Stylus C82 behaves with a Falcon ?
I have used an Epson Stylus 600 with very good results with Image Copy,
ST Writer and Everest for a number of years,but now need another printer
that will perform equally.
A visit down the high street revealed that most printers now seem to
be USB connection so choices now are very limited.

Any information concerning Atari-compatible printers presently on the
market would be most appreciated,and I am sure would be of interest to other
Atari Users as well.

Regards,

Paul.

1918. Playing MOD files on Non-STE?

Dear Atarians,

I used to really enjoy playing MOD music files on my STE. It no longer works after years of faithful service, and I am now using a Mega 2 system which doesn't seem to be able to use my STE MOD player software. Is there a software solution to this, or do I just need to buy a working STE machine? Thank you very much.

Sincerely, An Atarian Forever

Most MOD players need the STe sound hardware in order to work, However you
can use the Paula mod player on an ST as long as you install the Petra
ST sound driver. The sound quality is not as good as an STe and it's slow
(MOD playing will consume all system resources), but it's better than
nothing.

You can also get mod players for PC, if all else fails.

Hello, Martin, I use HD driver 7.6. I didn't know you could change the program flags on HDDRIVER.SYS. What program do you use to switch the flags? I have also used Cecile. I am also nervous about cutting and soldering, I'm not exactly an expert! I heard from another guy on the newsgroup named Brian Roland, and he said he did it and it solved his Scsi problems. I will let you know when I try it.

I have several ways. Most of the times I'm using the fileinfo.cpx that is
part of the Centurbo tools that you probably also have somewhere. If not,
they should still be on the Centurbo website (http://www.czuba-tech.com)

But I can also change the flags with my THiNG desktop.

And I have an old program called PRGFLAGS.PRG that can also do it.

Anyway, several programs that didn't run before with the CT2b might work
when you change one or two flags. Success not guaranteed, but it doesn't
hurt to experiment.

Hi,

Incase anyone here runs seti@home 24/7 such as myself, I thought I'd mention
there is an update to the seti@home client. Apparently a security issue.
It might be worth downloading this update.
As always thanks to Atari Omline News, Etc. for the great articles and
reporting the update.

You can view Team Atari stats below.
http://setiathome.ssl.berkeley.edu/stats/team/team_21046.html

New members are always welcome! ;o)

What ever happened to NoiseTracker for the ST? I still have it on an ST floppy, I think. I've kept my ST/Falcon floppies even to this day... a remnant nostalgia of the past, I suppose. Sure would be nice to hammer out some new .MODs again. My collection of the 80+ ones I did ages ago is fun to listen to, but... I'd rather be tromping the keys of a 1040ST keyboard and watching it all on a JVC-model Atari SC1224 monitor, composing them again! It might work on an STe, dunno. How would I get it onto my PC so I can Email it to someone that needs it? I think BeOS is the only OS that will read the ST's 720's ok... does NoiseTracker ST work with any PC Atari ST emulators? Which emulator is best? NoSTalgia? STonX? Steem?

Email me, if interested...

Luposian

Just b/w huh?? Can't see why it would not print in color, but
maybe it needs a more complete driver. How much did the machine
run you?

Martin, in the folder called FITTING in the CTB2 files, there is a
file called SOFTWARE.TXT. In there is the following mod:

<If you have problems with SCSI and/or AUDIO, you have now to modify a
hardware setting ON the CT2 :

There is 4 squared pads before the CPU of the CT2 just between 2 small
14
pins chips. The 2 left pads are connected together by a very small
track.
You have to cut this track and put a solder jumper on the two right
pads.
You have now a new SDMA timing and have to do again all the SCSI and
AUDIO
tests.

Note that this modification and the add of a HE14 connector on the
left
forward corner of the CT2 to light a panel led, are the only ones that
cannot cancel the warranty.

If the problem stills to be, please contact Rodolphe Czuba :
rczuba@free.fr or visit
www.czuba-tech.com >

But don't let me persuade you to do any thing you wouldn't feel
comfortable with! It seems like a pretty small thing to do though.
Mark

Or a Falcon, or a STE, or a TT or a MegaSte. If you get a Falcon, you can play back the Mods at 50khz 16bit stereo, sounds great. How does that sound on an Amiga?

Mark

Ps there is also a stereo hack for the Mega/STFM as well.

I just bought a BSE interface (serial and parallel ports) for my Portfolio. It says "BSE Universal Interface 0KB on the top. I haven't been able to find much information about it, but it has 128K of ROM with some programs (PBASIC, XTERM, etc.) and works as drive B (read only). I was wondering if there is a way to add RAM to the interface? I found a scrap of info on the web that leads me to believe it came in a 512K memory expansion version. Does anyone else have one of these. Can you shed light on the subject?

Hi all,

Just clearing out a room in my house to fit in the impending arrival of a new Anderson and have found this.

Also I have a TOS switcher from an old STe of mine that somebody can have for postage, (I don't know if it works or not though) it has TOS 1.62 and 2.06 on it.

For the supercharger:-

1948. [ANN] DGEM 0.16

Newsgroup: comp.sys.atari.st
Date: 2003-04-13 21:51:56 UTC
From: ptonthat@club-internet.fr
Message-ID: <3e99dbfa$0$20028$7a628cd7@news.club-internet.fr>
Source record: 28279

Bonjour :)

Rajah Lone and Daroou of Renaissance humbly present a
new release of DGEM : an 'embryo' of Dungeon Master
designed to run under GEM environement.

Special legals applies to this freeware, please read
the ST Guide documentation.

This release is dedicaced to all happy people at EIL3.

New in this release:
+ image Cache for fast reloading

<doc extract>
At first launch, and if you want a very fast loading, see
how to convert the images to the screen format into the
Cache:

1) Choose the path for the cache,
(on a writable disk with enough space)
2) Select "use converted images files",
3) Click on "convert DGX files",
4) Save the preferences.
</doc extract>

+ memory manager for images (much less Malloc calls, should
crash a bit less on old systems, though TOS 2.06 640*400*16c
is the minimum required)
+ use of TT-RAM if possible (experimental)
+ quicker display and sparing of memory (masks are only one
bitplane now)
+ extended preferences window with new options
+ console window for message and debug purposes
+ party summary and character sheets windows
+ delay and multiple actions in mecanisms, wall items can be
held on every faces of the wall tile.
+ new wall items: keyholes, coinholes, gemholes, torch holder,
spy eye, fountains, character mirrors
+ objects: everything from DM, CSB and TQ, but only manipulation
is possible now.
Are working: chest, scrolls, compass (in hand), keys,
coins, gems, mirror, magnifier
+ characters in party: at this time, works only as 'containors'
for objects. Their eyes are functional.

Comming in the next release: the life and death of characters.
Monsters should arrive at the 0.20 ;p

Hope you'll enjoy our work.

Rajah Lone and Daroou of Renaissance

I'm sure that is were a lot of Amiga's have ended up, broken stuff should be recycled. No different for broken Atari junk. (If you read the Bravo post it doesn't sound like there is much to salvage as far as working bits go)

Something to do with the current switched DAC in Paula, it has a unique ring to it. Point is, for about the $20 it costs (if that) to obtain an A500 you have a very capable MOD player. (and it's useful for other stuff too ofcourse, like retro gaming for instance)

I haven't found a MOD player for PC yet that is much chop :-(

Well, I think it's more related to the fact that the Amiga has a filter.
A lot of amiga modules are not bearable if you play them on a STE or an
Amiga with filter switched off because the samples are very bad.

Dbug

MODplug (for the PC) works great for playing all the .MODs of my own creation, plus others I've gotten. Now I just need a player/editor so I can change the speed on a .MOD or two of mine that're playing too slow.

1962. m68k Linux and et4000 card on TT config?

Newsgroup: comp.sys.atari.st
Date: 2003-04-14 21:32:36 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3e9b36f692e620@tripnet.se>
Source record: 28293

I have been busy installing Debian Potato m68k Linux dist on my TT today.
It does seem to work quite well apart from getting my et4000 graphics
card working well in 256 colours.

It does work well in mono with a bootargs file like:

-s -k linux root=/dev/sdd6 video=external:1024;768;1;n;0xfec00000;;0xfed80300;6;vga;1024

But if I try with 256 colours with:

-s -k linux root=/dev/sdd6 video=external:1024;768;8;p;0xfec00000;;0xfed80300;6;vga;1024

I get a white background and very light grey text impossible to read.
This looks like a palette issue. Tried having the old COLOR.CPX active
and got a dark screen with yellow text but then the TOS desktop is
completely out of order...

Any help on this would be nice. I'm a total newbie to Linux on any
platform...

I would also like to have a SLIP nullmodem connection to my other STinG
TT. is this an easy task in Linux?

I'm now to reboot into Linux again and try X11 to see if the TT will run
that at all. If that is OK then it's time to try Aranym :-)

MODplug works but isn't great if you compare it to an Amiga MOD player. Even Octamed for PC is hopeless. I thought this faster PC would fix the problem but running MODs in the background is a choppy affair :-(

It's about the only use I would have for a real Amiga now (apart from occasional hardware hacking) and I can't justify having one set up just for playing MODs at this time due to space restrictions. Otherwise it is the best low cost solution to playing MODs as they were intended to be heard.

Regards,

Clockmeister.

While we are on the subject, is there a DA for the Falcon that will play med and screamtracker files? I have some apps that will do it, but prefer to do it in the background. Also, I have never played a mod on any of my Atari's that sounded any different to an Amiga. Granted the PC sounds like tinny shite, tho.
Years ago I was in a club that was atari/amiga, and we always had compo's to see who could get the better result. Until the falcon came along.

Assuming they did not remove the old Epson compatibility mode it should
work in black and white with the older 9 and 24-pin Epson drivers. I've
used my C80 with my XEGS (my ST died so I can't test it with that, but
it should work if it works on the 8-bit).

1968. LNX/RAW partitions without HDDriver?

Newsgroup: comp.sys.atari.st
Date: 2003-04-15 07:06:15 UTC
From: Andrew <aos+usenet042003@boom.net>
Message-ID: <3e9baf67$0$1969$a726171b@news.hal-pc.org>
Source record: 28149

Hi folks. I'm trying to install MiNT on my Falcon, and I'd really like for it all to live on a ext2 filesystem, but the mke2fs program requires a partition type of LNX or RAW before it's willing to make a filesystem on said partition. I'm currently using CBHD as my hard disk driver, and I cannot figure out how to change the partiton ID without switching to HDDriver. Seems a bit silly to pay money for a driver so I can run a free OS.

Can anyone tell me if it's even possible to set my partition ID properly without using HDDriver, and if so, how to do it? Thanks.

-andrew

I never managed to get anything good to come out of the YM soundchip, it was awful and one of the reasons I switched to the Amiga. I heard Megablast on ST, and then on Amiga... need I say more. Shame the Falcon didn't come along a little earlier...

Regards,

Clockmeister.

By the way : non DMA sound ataris (mega ST and Had>s) will be able to have very decent MOD playing with NAtracker. It can be used as an accessory and so is able to play in background (by eating about all bandwith on a megaST) I'm very happy with it.

For those that have a DMA sound, Paula is excellent and cheap.

1971. [?] appl_tplay() and appl_trecord() on Hades

Newsgroup: comp.sys.atari.st
Date: 2003-04-15 11:48:32 UTC
From: François LE COAT <lecoat@lutece.net>
Message-ID: <3E9BF190.1040001@lutece.net>
Source record: 28151
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

I have a Hades 060, and I work mainly with MiNT+N.AES.
I recently discovered that the AES calls appl_tplay()
and appl_trecord() are working under plain TOS. It
means that you can record events, and you can replay
them under TOS. It is useful to make demos of programs.

Unfortunately, I also discovered that these system
calls are not working on recent AESes (on the Hades at
least). It means that a recorded sequence cannot be
replayed under those AESes. These faulty AESes are
all derived from MultiTOS, and all faulty. Therefore,
MultiTOS, N.AES, Geneva have bad implementation of
those system calls. On those systems, the mouse begins
to move, as if all was right, and then it crashes the
Hades. The only solution is to turn the power off.

Not many people use those AES calls for ATARI programs.
I'm even wondering if I am the only developer for it.
Would you already experienced this problem ?

All replies will be welcomed ...

Best regards,

I don't get it. What possible connection could there be between Linux and color.cpx, which is an Atari specific program? You can't run a cpx under Linux.

> I would also like to have a SLIP nullmodem connection to my other STinG

I've done it, following Patrice Mandin's howto on his website, and it works great. But the TT was running MiNT, so STinG wasn't used.

You're not intending to run ARAnyM under Linux on your TT, do you?

The connection betwween Linux and COLOR.CPX is the ET4000 card! If I
boot to TOS with this cpx active the palette gets all mixed upp so I
hardly can se the desktop in 256 colours. But, when I start the Linux
Bootstrap I get a sort of OK display in Linux with light yellow
characters over a dark bakground that is readable.

Without this little trick it's almost impossible to see anything under
Linux. So, it seems the Linux kernel simply does nothing to alter the
ET4000 palette.

>> I would also like to have a SLIP nullmodem connection to my other STinG

I'll check his site, thanks. As there is no Linux support for the
cartridge port Ethernet I'm using this is the only way to get a
connection with the Linux TT.

Now I only have to figure out which Linux "/dev/ttySn" goes to the TT
Modem 2 and if it will respond to the uncommon 153600 bps speed?

I already have a subnet configured on my other TT Modem 2 port and also
an Ethernet card to the main switch.

>> I'm now to reboot into Linux again and try X11 to see if the TT will run

Update: X11 exited with a "signal 11" and then I went to bed. It will off
course be very slow but anyway fun to see if I can get it running.

There are some settings for graphics modes in the X11 config file so
maybe the palette will be OK if I get that running?

>> that at all. If that is OK then it's time to try Aranym :-)
>
>You're not intending to run ARAnyM under Linux on your TT, do you?

No, I guess STonx is a better alternative... :-)

Actually, it would be very, very fun to get a virtual Atari running on a
real Atari regardless how slow it would run imho :-)

MiNT fdisk should be able to do this but I'm not even sure if it was ever
ported let alone if it will run under singleTOS

As I have the Debian CD in right now here is a part of
/install/atari/install.doc :

3) Partition your harddisk (or rather prepare partitions for Linux):
There is a partitioning tool for Linux/m68k called atari-fdisk, but for now
I recommend you partition your disk using a TOS partition editor or some disk
tool. If your partition editor doesn't have an option to edit the partition
type, you can do this crucial step at a later stage (from the booted temporary
install ramdisk). One of the partition editors supporting selection of
arbitrary partition types is SCSITool (Hard&Soft). There will be others,
select one to suit your need.

Somehow i have changed something in Jinnee and i do not know
what. But the result is that in a already opened windowscreen in
the upperleftcorner there's no longer the arrowsymbol that was
meant to indicate 'closing window' but a file symbol. Does
anyone know how to get this back in normal order?

Thanks,

Raoul Teulings

Great minds think alike? I actually ended up doing this last night. By the time I was done, I was too tired to come post it, though. :-) Unfortunately, however, it doesn't make EasyMiNT's install program happy. It still complains about not seeing a RAW or LNX partition. However, mke2fs.ttp works just fine now.

I suppose at this point, I'll give SCSITool and/or Cecille a shot.

Thanks for the advice.

The first thing i'd check would be the system font in current use, then i'd
check for 'skins'.

I would never compare an STFM's audio against an Amiga's. I would however,
compare a TT/STE/MegaSTE/Falcon, without a second thought. There is actually
a Stereo hack for the STFM too.

You are soooo slow! How... long... does... it... take... you.... to...
go... from...one... Atari... newsgroup... to... the... next?

Or maybe you actually read the message weeks ago and your brain finally
realized just today "Ooh, that's a post from Luposian I can reply to!"

You're such a sad plight of flesh. Go outside, get a deep breath of fresh
air, put a big happy grin on your face, strip down to your bare nakedness,
and then jump on a red ant hill and let the ants crawl up your arse and give
you deep, stinging colonic!

Hey, sure beats replying to my posts, that's for certain!

Message-ID: <3e9cadb2$0$1969$a726171b@news.hal-pc.org>
Source record: 28172

Andrew <aos+usenet042003@boom.net> wrote:
> I suppose at this point, I'll give SCSITool and/or Cecille a shot.

Well, I'm pretty confused at this point. I've created LNX and RAW partitions with Linux fdisk, with Cecile, and with SCSITool, and the FreeMiNT installer still insists every time that it can't find a LNX or RAW partition. I'm really unsure what's wrong. The partition I'm creating is definitely LNX or RAW, depending on which I've most recently made.

I'm using the internal IDE controller on the Falcon. Any known issues that would make the FreeMiNT installer barf?

Any other ideas anyone has would be greatly appreciated.

HI all

Per request I have started a new forum for ACE MIDI, the Softsynth for Atari Falcon.

http://groups.yahoo.com/group/acemidi/

To join simply click on "Join this group?" and follow the instructions.

This is THE user group for New Beat Productions Soft Synth for the Atari Falcon called ACE MIDI. There is also ACE TRACKER which is a tracker version, now in Beta stage. Patch sharing as well as synthisis techniques can be discussed specific to using ACE MIDI.

For more information visit
http://newbeat.atari.org
and the ACE MIDI page at TAMW:
http://tamw.atari-users.net/ace.htm

As far as I know Cecile don't support the XHDI protocol (the XHDI protocol
is required to access other partitions types than GEMDOS).

Don't know really... All I know about speed for now is that it is not as
fast as Magic overall :-)

Being a total newbie on Linux I have so far managed to get a working
Internet connection via 76800bps Modem2 nullmodem routed via my other TT
running STinG.

Have to enter the config commands manually, though as I haven't figured
out where in the startup scripts they should be put.

Anyway, quite fun to surf with Lynx...

Steve follows me around like a bad cold... it must be in his DNA or something. He's always ragging on my grandios ideas for the revival of Atari (as a hardware company), but I persist, nonetheless. My latest idea doesn't seem to be that far off, either... a bit more "possible" than the others I've had.

I just need to see how to get the price more affordable. Aiming for the $300 mark as the max. selling price.

This are the current (tenative) specs:

Project: Lynx II ls (Large Screen)
Screen type: TFT LCD
Screen size: approx. 6"-9"
Hardware: Single Board Computer (CPU speed between 500-800MHz; built-in 2D/3D video (up to 32Mb shared memory))
OS: TBA
Software Media: TBA

I'm just waiting for the company I found to get their vacuum molding operations going. Once that's in place, I will work on designing the case and get pricing on making a one-off. The drive model I'm looking into works with the OS I'm looking into. Sadly, the highest model works with nothing but Windows (drivers are Windows only). LCD's of the size and type I need are coming down in price. If I can carefully hack apart a working 486 laptop with a TFT screen (like the one I have a perfectly working TFT LCD panel from already, but the cable was torn, and the LCD is no longer supported, and specs are non-existant), I can throw together a working (but much slower) prototype much faster, since the LCD panel will be virtually free. The SBC is going to cost a bit, unless I can find a "sample" on eBay or elsewhere.

The sample demo game I plan to show off will be a somewhat-hilarious "sequel" of Pac-Man. Different from all the rest. Just need to find a programmer... or two.

As I like to say, "If I can accomplish it, I *will* accomplish it!"

Pipe Dream or not... it's something fun for me to plan and think about... only time will tell if it's meant to be or not.

Luposian

Fair enough. How about Hushi/SCSITool 6.01? (The only version I've got of that)
It certainly acts like it supports XHDI. Forgive my lack of knowledge here.
I've been out of the Atari scene for a while, and most of this stuff came along
after I drifted away.

I thought it was interesting that mke2fs.ttp works on my filesystem while the
FreeMiNT installer doesn't. Since mke2fs requires LNX/RAW filesystem type,
that would see to indicate that whatever hard disk driver I was running at
that time (can't even remember which one it was now) did support XHDI, but
the FreeMiNT installer still didn't work.

If I really have to, I'm sure I can get this running by creating the filesystem
with mke2fs.ttp and then unpacking the rootfs.tgz and all the rpms by hand.
I don't *need* the FreeMiNT installer per se. I just want a working MiNT
system that's based on stuff a little newer than KGMD.

The Brother 1240 laser printer is the only printer still on the market
that I am CERTAIN will work on an Atari. HP no longer sells PCL3
printers, and Epson no longer sells ESC/P2 printers. Someone posted a
year or so back that they were able to print from the Stylus C series,
but I do not remember the details.

From the Epson USA website:

Q: Is this printer compatible with MS-DOS based applications?
A: If you are trying print from a DOS based application, the printer may not be completely compatible due to the ESC/P raster printer language that is used by your printer. When printing from DOS, color printing is not available. You will need to use the control panel of the printer to replace ink cartridges and perform other maintenance functions.

Thus it appears that the printer will respond to ESC/P (non-raster) commands to some degree, at least as far as black printing is concerned.

2007. New on TAMW: New version of MIDI JOY

Newsgroup: comp.sys.atari.st
Date: 2003-04-17 05:57:50 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0304162157.5a8dca91@posting.google.com>
Source record: 28187

Hi all
Here is a recent exerpt from a post on Atari-MIDI:

>For those who love to play with MIDI-improvisation toys there is
>interesting news. The midi-improvisation tool MIDIJOY as written by me
>in 1992 has now a complete English manual, available in html.

>http://www.marsandmc.nl/atari/midijoy/

>Harry Koopman

Thanks Harry!!

This is great....we are continuing to get updates to our programs even in
2003!!
Talking about updates, I have updated my own MIDI Joy page at TAMW with the
new files...thanks Harry for a job well done.

http://tamw.atari-users.net/midijoy.htm

I would encourage members here to check out MIDI Joy, an excellent mouse
play application. The English manual is complete and now available.

> STFM TOS'es also.
>
> (*)
> Either didn't work at all or only unacceptable circumstances. Sorry too
> long ago. I do recall deciding to forget about trying to use them.

Well, these system calls usually work fine. For instance, it
works very well on all various versions of MagiC (Mac, PC, ATARI).
It even works nice under ARAnyM, with TOS and MagiC. But, for
instance, it doesn't work under ARAnyM with N.AES installed
(I haven't recently tried Geneva or XaAES).

That's very strange ... That's why I say that the recent AESes
derived from MultiTOS (MultiTOS, Geneva, N.AES) are faulty.
I've put it on evidence with my Hades 060, and with ARAnyM.
As nobody use this system calls, except me, I'm very embarrassed.

Maybe I could try XaAES, but it has other problems of compatibility ...
I also tried with STonX, TOSbox, STEmulator or TOS2WIN, but this is
rather a problem of compatibility with these emulators. The only
emulator that works is ARAnyM (except from MagiC).

Thanks for your help !

Best regards,

[slight topic drift]

According to my copy of the Compendium, it says something like "doesn't work on AES's before 1.40 without a patch from Atari"

(AES 1.4 arrived with Rainbow TOS [TOS 1.04])

What exactly was the problem? (The Compendium doesn't elaborate on this point)

What was the patch called, and where does one get it?

(I'm just curious [I've never used those two AES calls] and I use a TT [TOS 3.05] for my GEM programming)

The funcs are defined to record and play back events

```
appl_trecord( buffer, count ); // record count events into buffer
appl_tplay( buffer, count, speed ); // play back events from buffer
at speed%
```

Buffer is made up of an array of EVENTREC's which look something like this:

```
typedef struct {
short code; // 16 bit "event type"
long value; // 32 bit "event specific data"
} EVENTREC;
```

So the program has a line like this within it:

```
EVENTREC buffer[count];
```

AFAIK, you cannot say to the AES "I am only interested in [mouse movement/click, keyboard] events", so you'd need to allocate a buffer a lot larger than you'd really need before calling appl_trecord. Or else spin in a loop getting one event and analysing it before adding it to your buffer

(Apologies for my deviation from the original question)

Yes, and trusting my experience, it's badly implemented since
MultiTOS.

> (I'm just curious [I've never used those two AES calls] and I use a TT
> [TOS 3.05] for my GEM programming)

It works nice under plain TOS (on my Hades 060 it is TOS 3.06M).

> The funcs are defined to record and play back events

That's right. But you don't really need a large buffer. I put
16ko by default in my RECORD.ACC, but it can be enlarged by the
user.

> (Apologies for my deviation from the original question)

You don't need to be sorry. These AES system calls are very
badly documented. For instance the integer value "speed" in
appl_tplay(buffer, count, speed); is not documented at all.
4 seems to be a correct value, that plays event at 1/1 speed.
But it may be different depending on the AES ... That's
really tricky ! Trust me ...

Actually it is not- but about 35.7kHz (horizontal scan rate)- still sufficiently compatible for most VGA monitors' capabilities. Vertical rate is 501 times less, i.e. 71.2 Hz- mostly VGA compatible, too. Signal levels and are not exactly right, but passable to a VGA monitor.

This is improved greatly by ST(e) emulators, such as Backwards and
STE-X/Falcon-X (I think that's what it's called). I've found a ton of my old
ST stuff ran fine on my Falcon with these emulators, while they didn't work
at all without them. They help correct timing and memory handling issues.

I am about to get a custom cord that has this controller inside. It has the centronics 50 pin at one end and the atari DMA end on the other. I am new to Hard Drives on the ST, so what do I need to do to get this working?

I have a 810MB Quantum HD that I will be using, this should work ok. I plan on using a external SCSI box that has the SCSI 1 Centronics ports on it for a easy config.

My system is a Atari 1040STf w/1MB and TOS 1.04 (Rainbow)

Thanks
Tim

They seem to be adequately documented in "COMPUTE's Technical Reference
Guide ATARI ST VOLUME 2 AES" as well as in the Lattice C manuals.
The former does state that the functions currently (printing date is
1987) don't work, though.

>appl_tplay(buffer, count, speed); is not documented at all.

It's documented in both of the above.

>4 seems to be a correct value, that plays event at 1/1 speed.

The number is (according to the references above) supposed to be
a percentage of normal speed. That is, 100 should be normal speed,
50 half speed, 200 double speed, etc.

2026. EasyMint Problem

Newsgroup: comp.sys.atari.st
Date: 2003-04-17 23:41:26 UTC
From: michael.robillard@the-spa.com
Message-ID: <gbacnffSQ9c7pgKjXTWcoA@the-spa.com>
Source record: 27957

I seem to be having trouble installing EasyMint.
I have a Falcon030 with 14Mb

When installing I choose the Login option and I select the XAAES path

After the installation finished and the Mint program was loaded
and logged in as root
at the root@easymint/root> prompt I typed in xaaes
there was a pause but nothing happens I just go back to
root@easymint/root> prompt

When I entered shutdown at the above prompt I received the Following

the system is being halted now...
pid 69 (shutdown):fifo not list???
pid 69 (shutdown):fifo not list???
pid 69 (shutdown):fifo not list???

then system halted

Thank you

Not quite sure what exactly do you mean ;-) If you mean the arrow button that appears in the info line of each jinnee files window, then you might have turned it off - try Special -> Settings... -> Info line -> Buttons visible. The one you're missing is the "Closer" :-)

If you mean the standard close box that appears in all windows, not only jinnee's, then something is wrong with WINFRAME.SLB or WINFRAME.RSC in Gemsys:MagiC:Xtension folder.

I've some documentation :
An old Lattice C document,
DDFS,
Compendium,
PURE C doc.
But I didn't found anything precise about these system calls.

>>appl_tplay(buffer, count, speed); is not documented at all.
>
> It's documented in both of the above.
>
>>4 seems to be a correct value, that plays event at 1/1 speed.
>

> 50 half speed, 200 double speed, etc.

That's completely wrong. These docs have been written by guys
that didn't know anything and that never tested what they wrote.
I say 1/1 speed should be around 4 or 5.
It works like this with MagiC (ATARI, PC, MAC), TOS, ARAnyM ...
As far as I tested. It's a shame to write things like that !

What's missing?

The following is a condensed form of what the Lattice C manual says:

```
typedef struct {
long ap_event;
long ap_value;
} EVNTREC;

// Play back user's actions
int appl_tplay(const EVNTREC *mem, int num, int scale)

// Record user's actions
int appl_trecord(EVNTREC *mem, int num)

ap_event ap_value
0 - timer event elapsed time in system ticks (1/200 s)
1 - button event low word button state (1 down), high word clicks
2 - mouse event low word x coordinate, high word y coordinate
3 - keyboard event low word key code, high word shift key state

scale is a speed percentage from 1 to 10000.

appl_tplay always returns 1.
appl_trecord returns number of recorded events. Normally equal to
the number requested.

Note also that the functions are supposed to (according to these
references) record user actions as above. They are not supposed to
record any other kinds of AES messages.
I assume the 'timer event' in there is not an actual timer event,
but rather a time marker to enable the playback at normal speed
(the occurence of a timer event is obviously not a user action).

>> The number is (according to the references above) supposed to be
>> a percentage of normal speed. That is, 100 should be normal speed,
```

>> 50 half speed, 200 double speed, etc.
>
>That's completely wrong. These docs have been written by guys
>that didn't know anything and that never tested what they wrote.

Well, since they are pretty definite, I'd guess they were going by
some documents from Atari. It's not Compute's fault if Atari decided
to do something different once they got around to implementing the
functionality. ;-)

>I say 1/1 speed should be around 4 or 5.

Strange that they would want to do such a change.
The 200 clicks per second from the 'timer event' should have been
easy to handle.

>It works like this with MagiC (ATARI, PC, MAC), TOS, ARAnyM ...
>As far as I tested. It's a shame to write things like that !

See above.

Anyway, this functionality was badly thought out in the first place,
IMO. I'm not surprised that the multitasking AESes have avoided
implementing this function.
Since what's recorded is not (according to the above) actual effects
of user actions, but the actions themselves, replaying them will only
work as expected if the screen contents are exactly the same as when
they were recorded. And if the user does not touch the mouse or the
keyboard at the same time. Kind of useless.

The Compute book claims the ap_event field is a short, which seems
to make more sense.
It agrees with the Lattice C manuals regarding the rest, though.

Just a short note here.
There is actually no legal way to tell the VDI to move the mouse
pointer. I'm not sure what the normal AES does, but Atari, as well
as the MagiC folks, obviously had special knowledge of the inner
workings of their various OS components.
Geneva, N.AES, XaAES etc do not have that luxury.

And of course, whatever special means the Atari and MagiC AESes made
use of is likely to fail when the VDI is replaced...

It's not implemented in XaAES, but it implemented in N.AES and
Geneva, at least. But it's wrong.

> Since what's recorded is not (according to the above) actual effects

So, please have a look at my software Eureka :

http://eureka.atari.org/eurka304.zip

and test the RECORD.ACC accessory within it. You will see what
can be done with this very useful call. You can try under TOS
on every ATARI (I tested on 1040STf, MEGA STE 4, Falcon, TT,
Hades 060) under MagiC (every kind) or ARAnyM (TOS or MagiC).
It's much better than to dream reading a documentation, even
if it's made by ATARI Corps (bless them ...).

Good try ! And, keep it fun !

There will (most likely) be with fVDI once I get around to writing the
mouse handling code (probably not long now). Currently, fVDI relies on
the original VDI (or whatever other VDI was loaded before fVDI) to
handle the mouse and keyboard, and only makes use of the vex_ vectors
provided by that one.

And then there's the upcoming work to make the ARAnyM driver capable
of using a real (as in controlled by X, Windows, or whatever the host
graphics system is) mouse pointer, which will make even stuff like mouse
accelerators fail (since the VDI will no longer be in control of the
real mouse position at all).

Since NVDI appears to use the lineA variables in the same way as the
original VDI, it may not have a problem. Indeed, I would have
expected them to make sure stuff like this worked. Still, that doesn't
change the fact that the AES must resort to undocumented methods.

Of course, I could easily add a function for moving the mouse pointer
to fVDI, which could then be used by XaAES. ;-)

>So, please have a look at my software Eureka :
>
> http://eureka.atari.org/eurka304.zip

Looks like a nice program, though not something I have a use for.

>and test the RECORD.ACC accessory within it. You will see what
>can be done with this very useful call. You can try under TOS

If the circumstances are right, and the user cooperates, it can of
course be used (assuming the OS supports it).

I have actually even used it myself, in MGIF. The usage there was
precisely because I needed to move the mouse (not the displayed
pointer, since this was for full screen image display) to be able to
scroll a displayed image indefinitely using the mouse, and the VDI
didn't support that.
I guess I will have to update MGIF once I do the changes to fVDI that
I mentioned elsewhere. ;-)
Incidentally, the MGIF code has a special option to turn this feature
off since it is not compatible with all machines. Back then, there was
apparently a problem with Warp9 according to the MGIF documentation.

>It's much better than to dream reading a documentation, even
>if it's made by ATARI Corps (bless them ...).

Using undocumented behaviour is seldom a good idea.
If it's not documented, you should expect it to change at any time.
If it appears to be documented wrongly, it may be that it's the
implementation that is wrong, and that may be fixed at some point. ;-)

What is the complete path to xaaes ?
You could try typing something like this manually from your prompt:

root@easymint/root > cd /c/mint/xaaes/
root@easymint/root > ./xaaes.tos

The first line should be replaced by the correct path if you have chosen a
different location.
With easymint just typing "xaaes" should work, but I can remember special
situations that it didn't work on my Falcon in the past.

Let me know if it still doesn't work. Another good idea: try asking in the
mint mailing list (mailto:mint@fishpool.com). Subscribing to that list is
also a good idea.

>
> Makes a whole lot more sense than what you say they eventually
> implemented, though.

Yes, it's appealing as explanation. But it doesn't have anything
to do with the reality of what it does. It even doesn't give any
order of the range of values you can use ...

>>It's not implemented in XaAES, but it implemented in N.AES and
>>Geneva, at least. But it's wrong.
>
> In what way is it wrong? Or do you just mean that it does not work?

Well, it's partly working as I said before ...
If you have recorded a sequence on a correct configuration. This
is the case of the "EUREKA.REC" sequence that is included in the
archive of my software (Eurï¿½ka). Then when you try to replay it.

On XaAES, it completely skip it. When you start replay, it stops
immediately.

On N.AES, the mouse begins to move, but it stops 1 second later
with the ATARI freezed by a big bug ... You just have to turn the
power down.

On Geneva, it move very slooooooooooow ! The ATARI can't be rebooted
with <C-A-D>, because the computer is totally under control of a
slooooooooow turtle. I tried to change the "scale" factor of
appl_tplay(), but it has no effect ...

So, it seems that it could work, but it doesn't. That's why I
say that it is implemented, but badly implemented. That's all.

> I have actually even used it myself, in MGIF. The usage there was
> precisely because I needed to move the mouse (not the displayed
> pointer, since this was for full screen image display) to be able to
> scroll a displayed image indefinitely using the mouse, and the VDI
> didn't support that.

Ho, yes, I hadn't noticed that. For my soft, I don't generate
events, as you seems to do. I only record events in a big buffer
(16kb is quite enough), and then saving it as is in a *.REC file.
Then, I read the buffer with appl_tplay() every time I want.
It's a sort of mechanical piano that replays always the exact
same partition. I use it as a tool for making demos of Eureka.

> I guess I will have to update MGIF once I do the changes to fVDI that
> I mentioned elsewhere. ;-)

So, you will ? That's great !

>>It's much better than to dream reading a documentation, even

> If it's not documented, you should expect it to change at any time.
> If it appears to be documented wrongly, it may be that it's the
> implementation that is wrong, and that may be fixed at some point. ;-)

You're right. But keep in mind that it works the same way on
a great quantity of ATARI machines. You must respect that. And
ATARI TOS/AES/VDI are the references. As it works, not as it should
in a bad "documentation".

I told you about the DDFS documentation. It's french. It has been
made officially by ATARI France for the Falcon 030 developers. It's
the last official reference. There's nothing clear about these
system calls. Besides of that, it works also on a Falcon, as it works
on other platforms.

There's nothing to invent in this domain ...

Right. Bye for now ...

Doing stuff like this causes serious problems on my falcon. I find using
the appropriate vconsoles setup with the AES being on ALT-F10 works the
best for me. If you guys want any of my config details, just respond as
such.

Thanks

Magic allows you to use different design windows similar to windows skins, or you might have had something like XGEM installed. If this doesn't help you track it down you may simply have a corrupted jinnee.rsc

2049. [CT60] Latest news

Newsgroup: comp.sys.atari.st
Date: 2003-04-19 06:16:27 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1ftnl1f.de25w13qv51mN%NOSPAMS@wanadoo.fr>
Source record: 27981

Hi,

Here are the latest news about the CT60.

About hardware bugs, only bus arbitration problems seem to remain :
SCSI, DMA sound and Blitter can not be used. Thus NVDI and Magic are for the time being necessary. All audio softwares won' t work or at very low sampling rates. It is impossible to copy an audio track from a CD.

About the bandwidth, it seems according to Rodolphe, that while running at 72MHz, the bandwidth won't exceed 74Mb/s with the SDRAM, which I could verify.

At last, having checked numerous softwares from my harddisk with the latest versions of ABE60 and SDR60, the caches do work reliably with the two card I have in my possession (only one belongs to me ;-)). Only Cubase is a real problem while other programms do not need any patch at all (calamus, script, papillon, papyrus, purec, etc..). By the way, I am now always running my Falcon in turbo mode with activated caches.

Cubase quits claiming a Format Error and turning away the error does not help (is dma used from start?). This problem is not related to the hardware key but most probably to an internal software protection. You probably already know that Cubase makes direct hardware access to the DMA, DSP, SCSI or to the cartridge (this later only is normal), that it ridirects many interruptions and that it also plays around the cache in three places (here are patches for the 060 cache necessary). And I was about to forget MROS!
Well, for Cubase, there is still a while to go.....

Under some conditions, the cache of my 68060 unfortunately leads to crashes and errors when running at 72MHz, that is why I used a fall back solution at 66MHz (an oscillator that Rodolphe had given me). The 68060 processor that I had bought some two years ago from Rodolphe is a full version with Revision 1 (i.e. buggged). Probably some other models won't also run at 72MHz (which is also the upper limit for Amigas).
I saw that a reprogrammable oscillator exist, the CY27EE16 from Cypress which could be connected to the I2C port of the SDRAM (used for reading from the SDRAM to the EEPROM). It gave me the idea to use it in place of the socket of the current oscillator.

Although I am still lacking some informations from Rodolphe, I also started to make connections for the BUS acceleration thanks to dedicated conenctors :
- 40MHz to the DSP.
- midi & keyboard clocks (ACIAs).

- clock input 32MHz (self)
- clock output 40MHz (self)
I haven't connected the last SLCK signal (DMA clock????), which according to the schematics of the CT60 is the 8/16MHz Falcon Bus clock going through two F04 gates. I indeed still use 1/4th of a F08 instead of R221 because I never succeded in booting the Falcon with the two F04 gates in series. I have no idea wether Rodolphe plans to make some modifications here but it can be problematic with various clock patches. Well this simple workaround worked anyway very well on my two boards !

I made two snapshots of testbenches, that I might post on my website this week-end.

After 6 months without changes, I modified Aniplayer in order not to use the DSP when the caches of the 68060 are activated for the video codecs (for the mpeg audio tracks). When going through the host port for video, the software gets lost in speed.

I also modified the Picdesk software to detect the 32/40Mhz clocks of the Falcon for extended video resolutions.
That is all for now, not having had any news from Rodolphe since last saturday.

Didier.

PS. Thanks to Frederic Pecourt for his translation.

Problems like what ? There is a solution for (almost) every problem.

> I find using the appropriate vconsoles setup with the AES being on
> ALT-F10 works the best for me.

If it works with vconsoles it should also work without vconsoles, I should think. I also had installed vconsoles, in combination with easymint. And I loved those fullscreen consoles. But there also were unwanted side-effects with one or two of my apps. There is a solution for every problem, but usually also a problem for every solution ;-)

There is suppose to be software that allows the Falcon to run
about 90% of ST software available if I remember correctly. I have
seen Falcons for sale on Ebay for nothing less than $300.

I am not familiar with the exact item of which you speak, but I
suspect all you will need is driving software, like AHDI or HD Driver
and possibly an external terminator.

> I have a 810MB Quantum HD that I will be using, this should work ok. I plan

This should work fine. Note that you will probably have to partition
the drive into two (or optionally more) pieces.

>
For the sake of completeness...

HP does in fact make PCL3 enhanced printers, though not with their low
end models.

The 3820 mentions that "basic DOS printing" is possible, but gives no
details.
The 5550 does not mention DOS at all.
The 6122 claims "limited support for MS-DOS applications"
The 6127 does not mention DOS at all.
Finally, HP still makes the 1220C, which is expensive ($400) but is
known to be fully compatible with NVDI 5.

So in short, I am up to two (the 1220C and the Brother 1240) printers
that I know will work on an Atari, and there are a good dozen others
that might.

As an additional comment, the HP Laserjet 1000 does not work on the
Atari, but the HP Laserjet 1300 uses a different command set and just
might.

I think you should see a doc, there's an awful lot of repressed homosexuality there which just needs to get out properly. Perhaps outing yourself may help you, maybe even your colleagues in the IT dept will accept you once they see the true you.

There's nothing wrong with you buying muscle & fitness but pretending it's about you wanting to go to the gym to your friends is pure denial, just look at those pictures of oiled men and feel that stir in the trousers....It's nothing wrong.

Also I know that it's difficult for you trying to live a lie, having a girlfriend (if you were able to find one) is awkward when you actually like her brother more than her but if you come out of the closet all will be solved.

Of course, all this could be down to the way your Pop reared you, you see, those that shout the loudest normally have the most to hide.

Eh sweetheart..

I rescently tried a HP Laserjet 1200 but could not print anything due to
basic parallel port incompatibilty issues.

I do have a working Gemulator setup where this printer is located (my
job) so I guess I should test with pc hardware as well...

>to
>boot up once installed? did they finally get lilo working? or did they
>finally
>produce a working boot disk?

None of that actually... You have to use the BOOTSTRA.PRG when
installing and evertime you boot into Linux. There were still a slight
error in the BOOTARGS file. It tries to load LINUX.BIN kernel but it is
named LINUX in the dist. Also "nolangchooser" was not present and had to
be inserted by hand.

I had to manually edit BOOTARGS anyway because of my et4000 graphics card
using video=external etc.

After the first install phase (when debian wants to boot) you simply skip
the options to create a boot floppy and make the harddisk bootable.
Instead you boot into TOS and modify BOOTARGS to point to root=/dev/sdd5
(in my case). Start BOOTSTRA.PRG and now it boots perfectly from the
harddisk partition.

This makes it easy to have Linux as one of the boot options in XBOOT next
to Magic, TOS, Geneva or whatsoever. Imho a much safer method compared to
how lilo works on Intel computers.

The ROOT.BIN that is initially mounted when installing is still faulty so
you have to make the /dev/cdrom mountable by hand. I downloaded a more
rescent version where this is fixed from:

http://people.debian.org/~cts/debian-m68k/boot-floppies/current/

>> Basically only two problems that had to be resolved:
>>
>> Arguments in the bootargs file and a bug with non mounted /dev/cdrom in
>> the root.bin image during install.
>
>This has been around for some time, as I remember it needed 3 or for commands
>in a
>terminal window. Involved creating driver(s) for /dev/sr0 and /dev/sr1 for
>cd-rom
>drives.

See above!

As I have an ADSL "permanent" Internet connection I wanted to get the
installation online for apt downloads. By loading the Net "dummy" and
SLIP drivers this turned out to be possible.

I have a second TT here running Magic whith a "dongle port" Ethernet
adaptor using the STinG ip stack. I simply(?) had that this TT route
traffic to its Modem2 SLIP subnet and then on the Debian TT first shut
down the dummy network adaptor and then setup a Modem2 SPLIP connection:

```
slattach -p slip -s 57600 /dev/ttyS1 &
ifconfig sl0 192.168.0.194 pointopoint 192.168.0.193 mtu 1500 up
route add default gw 192.168.0.193
```

Note that 57600 actually produces 76800 bps on Modem2!

By opening a second terminal before the installation process wants to go
online this worked beautifully, so now I have all the security updates
etc. and apt could fetch Debian packets both from my cdrom and the
Internet.

Then in "tasksel" simply select "UNIX server" and avoid anything that has
to do with X and "desktop computer" as I have not got X working at all.

The installation takes very long time so you need a whole day or so.
Unfortunately there are some configuration prompts here and there so you
can't simply let it run on its own over night but have to check the
terminal now and then.

[I will post a copy of this mail to comp.sys.atari.st as others may
benefit from the info. Hope you don't mind and after all the thread
originated there anyway...]

I received an E-mail response to my query and was told to use
STZIP.PRG to unzip XAAESXXX.ZIP because the UNZIP.TTP does not extract
all of the files.I unzip XAAES963 with STZIP.PRG and when I type
xaaes at the root@easymint/root > XAAES will run.

I also seem to have gotten rid of pid # (shutdown):fifo not on list

An observation I was having this trouble using the STANDARD.TAR that
includes GLUESTIK and MGW,when I went to the STANDARD.TAR without
GLUESTIK and MGW everything seem to work out fine

Mike

As far as I know almost all TOS versions support autobooting hard drives.
However TOS versions less than 2.0 do not support autobooting from an IDE
interfaces, such as the Mario Becroft design.....

All of versions of TOS support autobooting of the hard disk, however, you need to have the hard disk driver in order for the drive to autoboot.

The ST was not designed to recognize the HD without the driver.

2075. Falcon keyboard problems

Newsgroup: comp.sys.atari.st
Date: 2003-04-20 21:22:47 UTC
From: Herr Professor <null@null.cx>
Message-ID: <pg36avkinrtkcfr5lii3476kkk2g27gih9@4ax.com>
Source record: 28057

I've veen unable to use my deka 2 interface with my falcon for some time, and i just gotten a german falcon keyboard and it still does not work. I think I have it the connections aligned correctly, it looks something like this:

Keyboard Side Mobo Side
Pin
Pin
Slot Pin
Slot Pin
Slot Pin
Slot Pin
Slot Pin
Slot Pin
Filled Slot No Pin
Slot Pin

However when Boot the falcon, it boots to the desktop and I cannot control the mouse, nor move it with the keyboard shortcuts. The only indication that anything is connected is a amber light on the lower left hand side of the keyboard is connected.

Any ideas on what could be the matter?

Peter.

On old TV commercials, they used to compare the product advertised
to a "brand-X". Perhaps these are all "brand-X" software... ;-)

2083. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.st
Date: 2003-04-21 10:17:17 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0304210303030.22545-100000@shell1.aracnet.com>
Source record: 28065
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail me or call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.
---------- Forwarded message ----------
This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! Even if one person wanted to take it all, it would take several trips. It's more likely this job will be done by several interested parties. DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money!So, are you Interested? E-Mail Atari@aracnet.com or I prefer you call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors,

I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

The TOS checks the ACSI connector when booting to see if theres a bootable hard drive on it. If so, it boots. If not it goes to the floppy drive. Its also possible to autoboot from the cartridge port, i cant remember if it checks this before the ACSI port or what order its in.

Smeg.

2085. SC1435 Monitor

Hi Tim!

No, only the first time you use the driver software. This installs the driver on the boot partition of the hard drive. You then need to install the icons for the drives manually with the TOS desktop - others like Thing and jinnee have an 'Install drives' or 'Mount devices' menu function to do this. Don't forget to save the desktop or configuration, so that the drive icons will be there next time you boot.

Note that you should keep a copy of the driver software handy on a floppy, just in case the boot sector gets corrupted.

Regards, /Peter/

Great thanks,

So what HD software do you recommend? I will be using ICD's The Link 1 and
a Quantum 810MB SCSI drive.

Tim

The nearest thing is the Mario BeCroft IDE adapter. You can cram it and a
2.5" IDE in the ST case. If you want to keep your existing TOS then you will
need to boot from floppy as you need TOS 2.0 or later to boot an IDE drive.

Free: AHDI

Not free, but should have been included with your Link: ICD

Not free, but very powerful and worth purchasing: HD Driver

Note that you will have a 512Mb partition limit if you use normal TOS.
Thus, your drive will require at least two partitions.

With TOS 1.04 the maximum partition size is 256 MB. For 512 MB per
partition TOS 2.0x is required. YOu do not have to take care of the
partition type. The software used for partitioning the drive will handle
this automatically.

Hi Tim!

The best undoubtedly is HDDRIVER from Uwe Seimet, but that's
commercial although you can download a restricted demo from
http://www.seimet.de/atari_english.html
if you have web access. It's just possible you may need to buy
this one, as some Quantum drives need either parity checking or
initiator identification to make them work - not sure if yours is
one of those. It's available with English manual from Atari
Workshop (mail them at info@atari-workshop.co.uk, or see
www.atari-workshop.co.uk). Price is UKP 29.95.

Alternatives are the Shareware (or PD?) CBHD by Claus Brod and I
understand that the last version of ICD's driver can be downloaded
free too - there was an address for this recently in this conference.

Regards, /Peter/

A .SON file from what application?

Note that file extensions themselves mostly does not tell what sort of
file you really have neither on Atari nor in Windows. We all know a .DOC
file is a Wordplus file don't we... :-)

Hi Uwe,

While I don't doubt you, I did take the time to look up the maximum
partition limits and I read that 1.04 was the first 512MB capable OS.
Apparently what I read was wrong. So all 1.x TOS has a 256MB
partition size limit?

Galen

I'm not sure about TOS 1.6, but 1.0x has a 256 MB limit and I think it
is the same with TOS 1.6.
With TOS 1.0x the maximum number of sectors per partitions is limited,
which results in the 256 MB size limit.

If these are Notator SL files, you could send the files to someone who still uses Notator, (I do) and have them converted to midi
files. How many is a substantial number? I may be able to convert them for you, depending on the time involved. You can e-mail me
directly if you like (remove <sick-of-spam>).

2115. Stock control software for the ST

Newsgroup: comp.sys.atari.st
Date: 2003-04-23 09:10:21 UTC
From: G Swaine <gswaine@the-gluepot.com>
Message-ID: <b85l6q$dv8$1@news.comnet.co.nz>
Source record: 28097

Is there anyone still interested in stock/inventory control software for the ST/TT/Falcon computer range?

I am currently doing a complete rewrite of my Stocker software, and am interested in getting a few ideas as to what features you require (and any rules you may impose on your data)

The software currently imposes only one rule : all data (such as Stock, Suppliers, Sales Taxes) are given a code number, and this code number must be unique, and is not changable once created, as it is used to identify the data globally. The data related to the code number is changable, however.

At present, it runs under GEM, and requires an 80 column screen mode (ST Medium, ST High, TT Medium screen resolution or better), and a correctly installed version of GDOS (bitmap, FontGDOS, SpeedoGDOS, or one of the free/shareware equivalents) will be needed to be able to print

The software is currently being written on my TT, and (at the moment) requires a 68030 and FPU to run - but any future releases will be recompiled to run on a regular 68000 ST. I anticipate that it will need 1.5 to 2.0 megs of RAM (unlike the previous version which needed 2.5+ MB) The amount of RAM required may increase somewhat if you use a page-oriented printer such as Ataris SLM laser printer

If you'd like to become part of a betatest/feedback group for the program, drop me a note via the intermediary address in my signature.

(An earlier version [version 0.27 from mid-2002] is available for download from http://atari.net.nz/gem/software/stocker.html)

I'm actually quite interested in such a thing. I would like to build a GEM inventory management application that uses a backend that can create disk database files or use a MySQL server. This way I can add items to an inventory and create a web application to view the inventory, modify things, create an online store, etc. I've always toyed with the idea of creating something along the ideals of stocker. What language are you writing this in? It'd be cool to port it to gcc so you can compile against mysql libraries amongst other things.

Thanks
Mark

Thanks a lot.
I think that the major problem is SCAT-GAT=0 on my Falcon., because the
SCAT-GAT is forced on 0. (why ? I remember that it's an unknow bug)

David Cure is going to test SCSI on his Falcon.

2119. Re: ST's and Autobooting HD? Can I format HD FAT?

Newsgroup: comp.sys.atari.st
Date: 2003-04-23 18:54:26 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vadob1i9v62l1f@corp.supernews.com>
Source record: 28100
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Thanks for all the replies. I now have another question. Can I format my Quantum 810MB SCSI HD on a PC in FAT and use that with the atari? That way I can transfer all my programs from STeem to it and just plug and go! If so what HD driver software will allow this and what size should I partition the drive? Also would it matter if it is Primary and Extended in PC and will it work on the ST? Currently it is one large FAT 808MB Partition on the PC.

Thanks!!
Tim

This is kind-of strange ;)

I currently program for a PC running M$-DOG (I also write a little bit of GEM code here and there), and would like to try my hand at coding something that runs on the ST. Does anyone know of any good 386->68K cross-compilers that specifically target the ST? Or does anyone know if there is something that I could build in DJGPP that could compile a TOS (or GEM) app for the ST? (Also, I have an Infocom interpreter for PC GEM - Turbo C++ 1.01 that I would like to port to ST GEM and EMUTOS.)

Thanks in advance.

-uso.

Hi guys, I need a muso's help;-). My associate say's that a "chip tune" is a "Mid file", which is a collection of triggered samples. Now the original SC-55 was sample based, but, my thought is that GM is only a standard that defines what sounds are to be used, not how to create it. Not a specific sample trigger as such. Also Midi predates 1991, as any atari user will testify. I can recall early synths, that were unable to store samples. Also a Sid and a pokey tune are both chip tunes, correct? So by definition he is incorrect.

Any Help?

Mark

Download latest version of Creator or Notator for Atari (goto notator.org
for info)
Open the *.son file using the above on your Atari.
Save As *.mid file.
You may have to do some fiddling with your *.mid file on your PC.

A file with the extension ".mid" is a "MIDIFILE" or "STANDARD MIDI
FILE." It's meant to allow DIFFERENT midi sequencers to exchange data
by being a "standard" that any sequencer can support. Typically, a
sequencer will load & save files in its own proprietary format AND
".mid" format for transfer to another sequencer.

Midi data is NOT samples, simply instructions as to which notes (and
lots of other stuff) are to be played. If you play midi data into a
sample-playback synth or sampler, then you are indeed playing a
"collection of triggered samples", but that's a function of the
instrument being played by the midi data, not midi itself. Sorry if I
misunderstood and you know all this.

Yes, early synths were unable to store samples; but synths have used
many different forms of sound-producing technology, such as analog
subtractive (old Moogs, Oberheims, Prophet 5/10, etc.) and FM (Yamaha
DX7/9/etc. etc. etc.) Many of these older synths use midi (I have a
midi retrofit kit in my Oberheim OBX-A, which I bought in the late
1970s!). The Korg M1 was the first, or among the first "sample
playback" synths.

GM is "General Midi"--a standard definition of patch numbers to sounds.
This is separate from "standard midifiles". A GM file can be in SMF
format or a proprietary sequencer format, it only refers to the
assignment of patches.

Didn't mean for this to get so long, sorry!

You could run a native ST compiler under emulation of course. However there is a cross compiler (binary) that runs under Cygwin. I *think* this is the link (looks like it anyway)...
http://sparemint.atariforge.net/sparemint/cross-mint/cygwin/

Target is MiNT but just avoid making MiNT calls. I posted something in st.programmer where I figured out how to get it to issue CR/LF instead of LF on the console.

Knock off the "/cygwin" and there's a cross for Linux. Never tried that myself.

> work on the ST? Currently it is one large FAT 808MB Partition on the PC.

With MagiC or MINT you can read and write PC-compatible FAT or FAT32
partitions.
Without MagiC or MiNT you can create a single (!) partition that is both
PC and Atari compatible with HDDRIVER. Note, however, that only one
partition per hard disk drive is possible in this case. As the maximum
partition size for the ST is 256 MB and for a MegaSTE/TT is 512 MB you
would not be able to use the full capacity of your drive.

I'm writing it using Lattice C, and have written it from scratch.

It does not currently have any way of linking to a SQL server, but this
could be added later if necessary.

The program uses a proprietary disc file format (which has changed from the
earlier version, and I have a nearly-working data import feature builtin to
the app)

Are the MySQL libs written in C or C++? I could probably rework my app to
talk to the SQL libs if they are in C, and have a reasonably commented set
of source files documenting the interface.

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.
---------- Forwarded message ----------
This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer!

Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives,
as-is as well as parts/incomplete SF354/SF314 Disk Drives.

Hm, I'll check it out. I still have to figure out how to do *real*
graphics and keyboard stuff in GEM, though... :\

Does this compiler offer a DR-like API to GEM? Maybe I'll find out in
a couple minutes...if so, I could write the code cross-platform (DOS
80386/TOS 68000). *g*

-uso.

2138. [OT] Calamus WinPack on Linux/wine almost OK

Newsgroup: comp.sys.atari.st

If somebody is interested in to give it a try (and deal/help with the
few display problems), search calamus debug on the wine usergroup:

comp . emulators . ms-windows . wine

goes for Lite version and STemulator too.
A bit off topic but ST programs anyway.

salut

2139. Looking for Swiftcalc or shareware equivalent to open old files in PowerST emulator

Newsgroup: comp.sys.atari.st

There's MySQL libs for C and C++. They are meant to compile on a *nix environment but I'm fairly sure they would compile under MiNT. But the resulting lib probably wouldn't be useable via lattice C. Which means you'll have to get Lattice C to compile the lib - could be painstaking.

Thanks
Mark

2141. Power supply wire question

Newsgroup: comp.sys.atari.st
Date: 2003-04-24 20:25:31 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0304241225.52fe6b1f@posting.google.com>
Source record: 28123

Hello everyone,

I just made a cable to allow an ATX power supply to run a Falcon. Now that it's up and running, however, I find myself wondering why the Falcon uses three red and four black wires to carry current. I mapped all these wires to a single plug on the PC power supply, and I'm a little worried that the current draw might be too severe for the single PC wire.

Any ideas?

Galen

You probably mean BACKWARD III.

There is also a more simple program named STE2FALC.

> I forget which is which and I think only one of them is "standard".

Format 0 has all data on one track, Format 1 has separate tracks. And
there is also a Format 2. This one also has separate tracks but is
organized differently. As far as I know format 2 isn't used much. But all
three formats have been defined in the official MIDI FILE specification
and in that respect are all equally "standard". That's why it's called a
Standard Midi File (SMF).

This is more a thread for one of the usenet groups dedicated to MIDI like
alt.music.midi or comp.music.midi.

> single PC wire.
>
> Any ideas?

Yep. Its simply that a PC motherboard with CPU and PCI cards etc, will draw A LOT of current at 5V, but not much at 12/-12/-5V. Each wire from the PSU will only carry a few amps before the resistance of the wire causes heating. Thats why instead of a single very thick wire, they use multiple smaller diameter wires. Some PC power supplies tell you how much current they can supply for each voltage. I have a bench supply that I made out of an old mainframe PSU that gives me 350W split between 5,12,-5,-12, and 24V, and the 5V output is something like 50 amps (which would burn a 2.5mm sq wire very quickly), while the 12V is 8A and the -12 and -5 are about 2A.

In the case of the Falcon, I would use several of the wires from the PSU the same way its wired in the Falcons PSU, to be absolutley sure that there is enough current getting thru to the Falcon, and the PSU/wires dont get hot.

Smeg.

Yeah, I would do that except I have absolutely no idea how to build
an RPM or SRPM and I looked.. I'll try to build one because the old
ncftp was annoying pretty much only in that it wouldn't accept passwords
over 8 characters which is like a religion for me to have 40 character
passwords ;)

Thanks

Isn't it surprising how if you leave something for a while you have a new idea.

I just tried to Sync my Handspring device using Pilot-Link and got it working in minutes.

Like before I started by enabling the Mint serial device drivers UART and MFP and I checked that the HSModem ones were still disabled, they were because I now use an ADSL modem.

A quick test and nothing worked so I disabled the STiNG CPX modules and realised that I had not done this before !

I tried Pilot-Link again using modem1, serial1 and serial2 and that didn't work but looking in U:\dev I saw that there is now a ttyS0, ttyS1 and ttyS3

ttyS1 works as Frank described.

Excellent news.

Regards,

Peter

I presume that Linux and NetBSD have more modern printer drivers than
NVDI supports ? Could one of the VDIs be adapted to use these drivers ?
It might not be very efficient but that is surely better than nothing.

No doubt this raises the whole issue of USB again.

2163. The Link 1 SCSI adaptor problems

Newsgroup: comp.sys.atari.st
Date: 2003-04-26 06:19:54 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vak98calfle6b@corp.supernews.com>
Source record: 28145
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I got the Link 1 from a 1040STE bundle off eBay and it seems the adaptor is bad. When I hook it up to a SyQuest EZ135 and run the ICS AdSCSI tools on bootup 9/10 times it will say no Host Adaptor. I have been able to get the unit to work a few times (actually booted off the EZ135 disk) but it definetely seems it is bad. Has anyone else seen a problem like this with these?

I also tested the DMA cable pin for pin and it seems to be ok, so I doublt it is the cable.

I guess I will have to go ahead and buy the Link 2 after all.

Thanks
Tim

Calm down, man! Chill!

OK, maybe I didn't phrase that properly. If you don't want to go rooting through boxes making lists of titles, I'm not asking you to (but it would of course be very nice if you did). But if you knew offhand just a couple of titles (especially if they're rare), and could mention them, it might make it easier for me to decide whether I want the stuff (I'm really sorry to have to ask, but I don't want to drive to Manchester and pick up 25 games if I've alredy got most or all of them). It might also attract more people to your post - seeing as most Atari games can be downloaded from a multitude of websites in minutes, you're going to have trouble attracting many potential takers to collect them from you.

But seriously, you said there's only 25 of them. Is a list of 25 names really too much trouble to make?

Tom

2165. NVDI and FVDI

Hello all,

In the fvdi docs it is noted that fvdi can run alongside nvdi
as long as you:
1) remove the nvdi video drivers
2) run nvdi after fvdi

For my first and only question, which files inside C:\gemsys
pertain to the nvdi video drivers and how can you remove them
such that everything will play nice and be happy?

Thanks
Mark

It's the set of 5 files called NVDIDRV?.SYS.

Be warned though, if you ever need to boot without FVDI but with NVDI, you need to re-instate them. This is where I boot switcher program comes in handy! The easiest way I've found to manage it is to create a folder inside your drivers folder called HIDE then move those files into there. Then boot with both FVDI and NVDI. Then when the time comes, copy them back out of there and disable FVDI, then reboot.

2167. AdSCSI Micro and 2Gig = bad?

Newsgroup: comp.sys.atari.st
Date: 2003-04-26 11:51:51 UTC
From: Thomas Havemeister <twh1@gmx.de>
Message-ID: <b8drsk$92uiv$1@ID-112582.news.dfncis.de>
Source record: 27999

Howdy!

I want to mount a internal HDD inside of my MEGA ST using the AdSCSI
Micro unit. I have tried it with these HDDs without success:

* Quantum Fireball TM2100S 2G HDD
* IBM DCAS-32160 2G HDD

Both are not working. The Quantum has no parity-disable jumper, so this
could be the problem with that one. On the other side I bought
especially the IBM which HAS a parity-disable jumper. Also, no success
with this one.

This is what happens: Turn on the Mega, the HDD spins on, the FDD-Lights
shortly flash up (Disk is not booting!!), then a green desktop apears
with no icons and disabled menu items. That's all. I can't use the
AdSCSI Utilities, because no drive is availble.

Argh!! This is really annoying, because I've bought the IBM on Ebay
because it HAS a parity-disable jumper. Could it be, that both HDDs
aren't compatible to the AdSCSI Micro??!

Is there a list with HDDs which are reported to work fine?

when I'm changing the direction of the cablem, the desktop appears
immediately.

I can't change the power supply, because it's a part of the original
Mega ST. How should that be possible?! This even not mentioned in manual...

Hi Martin,
Guess my memory is faulty! I was recalling the export feature of
Midisoft Studio which is either type 0 (Simple/Single track) or type 1
(Normal/Multitrack). Somehow the term "standard" got mixed in!

Hi, Thomas!

TH> when I'm changing the direction of the cablem, the desktop appears
TH> immediately.

So the original direction should be the correct one. If you have a look at the PCBs you should find a single square soldering pad per connector. This indicates pin 1...

TH> I can't change the power supply, because it's a part of the original
TH> Mega ST. How should that be possible?! This even not mentioned in manual...

You can try this two ways:

a) replace the Mega STs power supply by a standard AT power supply
(re-use the Mega ST power plug for the AT power supply)
b) use the AT power supply for the HDD only

If your Mega ST is not upgraded (PAKed f.ex), then its power supply should be strong enough though.

I asked google for your AdSCSI Micro and found it at:

<http://www.icd.com/atari/>

There it says the adapter uses the SCSI bus as power supply, so make sure your HDD provides +5V ("TermPWR") on pin 26 (here I am not sure).

Did you check SCSI chain termination?

Your AdSCSI Micro has been working before your recent attempts?

Regards,

Alexander

The best way to do this is with a tiny auto folder program that looks
for the fvdi binary, and if it's found renames or moves the nvdi*.sys files
for you. Likewise if not found it could put the files back as they were.

There is such a program made for nova users already as the nova driver runs
along side nvdi in the same manner. If the source is available it just
needs a tweak. ;-)

Take a look in the download section of http://atari.nvg.org/. I made such a program for the Nova card years ago, and updated it to support fVDI when I got myb Eclipse. Sources included in the archive.

I dont think there is one anymore, at least all the PC floppy drives I have seen lately dont even have the ID jumper anymore, so you wont be able to change it from drive 1 (PC A:) to drive 0 (Everything else A:) unless you can find the right solder pad.

You might have some luck if you know a local computer dealer who has loads of used floppy drives, and you know him enough for him to let you look through/test them all.

Smeg.

Bonsoir :)

I think I have seen this program in the fVDI/Eclipse utilz, but
I can't remember the url. Have to search with google.

Bye

I'm fairly sure that I saw a thread hereabouts that suggested that using a
PC floppy ribbon cable was an answer, plugging the drive into the conenctor
with the twist.

Cheers

Derryck

The PC floppy is jumper set to Drive B and the twist in the cable (at the end of the standard PC ribbon) turns it back into Drive A. I have tried this in the past - keeping the drive set to B and using a PC twisted cable, but it didnt with any drives I had at the time. Sometimes the drive light would come on when double clicked, but the best I ever got was a read error. The only solution was to change the jumper and use a straight cable.

It should. I think all drives in the Mega ST range were double sided from
the word go, so you shouldnt even need to modify the SF314's case.

Use the AES and a resource editor where you can. There's toolkits as
well but can't give any recommendations 'cos I never used 'em (had my
own).

> Does this compiler offer a DR-like API to GEM?
```

You'll be expecting it to offer whatever MiNT offers - well I would anyway. I had it installed mainly as "another compiler" through which to run code that was supposed to be portable across Win/Unix.

>Maybe I'll find out in
> a couple minutes...if so, I could write the code cross-platform (DOS
> 80386/TOS 68000). *g*

Those are binaries you'll have got. Just untar them (iirc) in the root and maybe setup some symlinks to all the binaries - they get a bit lengthy to type even for the odd makefile. Before that untar them somewhere else of course - just in case I've remembered wrong.

Let me think... about all you need of Cygwin is to pick enough stuff out of "setup" (http://www.cygwin.com/setup.exe in case you haven't got it) to give you a command-line. Select whichever of the myriad of packages has "Bash" in it and that should do the trick. An NT based system is best for Cygwin though Win9x ought to cope with these needs okay. Maybe you know all this anyway so I'll shut up. If you don't I'll happily waffle on some more.

Sorry about the delay... I toasted KDE and am busy de-toastifing atm! Mea Maxima ... ;-)

Source record: 28022

Hi All

==========

file : 2714536_velvet_spaceace.mp3

You can access this file at the URL
http://www.artsong.org/cnf/Warehouse/2714536_velvet_spaceace.mp3
Please see http://www.artsong.org/cnf/ for more info and good tunes

==========

Here is another recent piece. This is a Demo for ACE, the softsynth for the Atari Falcon Computer. (about 2 megs)It used Tunesmith (Jim Johnson..see http://tamw.atari-users.net/tunsmith.htm) and Music Mouse (Laurie Spiegel.. see http://tamw.atari-users.net/mmouse.htm) running on an Atari STE driving ACE on the Falcon. For the Tunesmith part, ACE was put into Multi-timbral mode and patches ajusted accordenly. The echo effects were all from ACE, so no other processing was done on it. There is no keyboard work. It is all generated from Tunesmith (adjusting the parameters live) and Music Mouse Playing, which is actually an alternate controller.

This piece is a showcase on all the different sounds you can pull from ACE. Its amazing all of this is coming out of an Atari-Falcon Computer! Who would have know in this day of 2003? :-)

Hi Tim,

The Links can go bad, but I wonder if there is a timing issue. Try
booting with the Syquest off. Then turn it on and wait a minute or so
before trying to access the hard drive with utility software from the
floppy drive. I'd also try adding an external terminator to your
Syquest before giving up.

> So in short, I am up to two (the 1220C and the Brother 1240) printers
> that I know will work on an Atari, and there are a good dozen others
> that might.

Hello everyone,

James Alexander sent me an email stating that the HP 5550 works under
Pagestream in both 300DPI color and B&W using the HP550C driver.
Although he didn't have NVDI, I'm confident that anything that accepts
the Pagestream driver will work under NVDI. Thus the list is up to
three currently available Atari based printers (along with cost --
only those printers under $400US are included)...

HP 1220C deskjet -- $400US
HP 5550 deskjet -- $130US
Brother 1440 laser -- $230US (I said 1240 before, which works, but is
discontinued)

Currently available printers that are fairly likely to work with the
Atari...

HP Deskjets 3820, 6122, 6177
HP Laserjet 1300
Epson Stylus C62, C82
Epson Stylus Photo 8xx and 9xx series
Brother Laser 5050 (Epson FX emulation!?!)

Printers that do not work with the Atari...

Many not listed above, including
HP Laserjet 1000
HP Laserjet 1100

Please note that "work" is defined as 300dpi black and 300dpi CMYK (on color capable printers). Resolutions above 600/720dpi and newer features (like 5 & 6 color printing) are unlikely to work.

I didn't mention it before, but the Epson FX880+ ($300US) is a 9 pin dot matrix printer that hasn't changed much in the last ten years, and it will definitely work with our Ataris. Print quality is a step backwards and it's noisy, but impact printers last forever and they remain the cheapest way to put text on paper.

If you purchase a new printer and find that it works on your Atari, kindly send me an email, and I'll update this list.

Galen

2196. Information about Falcon 030

Hi everybody,
I got a Falcon some day ago but I don't know this computer very well.
I have some question if you can help me:

- When I turn on, the internal hard disk seems to be live during Atari logo sequence start (I heard the spin-up noise), but after the ROM TOS starts, no Hard disk icon appears on desktop. Is the hard disk broken or do I need some additional software for seeing and formatting it?
- What HD 2.5" models are compatible with Falcon?
- Is the High Density 1.44Mb PC floppy disk drive compatible with Falcon?
- Is there some good web site where I can find software/manuals for Falcon?

Thank you in advance :-)

Regards

Use the :Install Devices" option. If it will not show partitions from HDD
there is a possibility that there is no partition on it. In this case you
have to repartition it.

> - What HD 2.5" models are compatible with Falcon?

All. (please correct me if there are any exceptions).

That would depend on the mech itself. There are 3 different ones that Atari used. The 1/3 height (5/8" wide "rhombus" shaped button on the lower right side), the 1/2 height (1 3/4" "rhombus" shaped button below the drive opening) and the 1/2 height (obsolete square button on the lower right side) drives. They will not interchange. Make sure the drive is correct for the case you are using.

Some Quantum fireball and some IBM DCAS require the computer to have a SCSI of its own (initiator identification). If this is the case with your drives you can only use them with a LINK96/97 host adapter. Other host adapters do not provide initiator identification.
Before trying anything else ensure that the drives are recognised by a decent ID check, e. g. the one from HDDRIVER, which is also included in the demo version (http://www.seimet.de/atari_german.html).

If there are actually bad sectors on this drive formatting it may help,
indeed. Note, however, that there are numerous other reasons why data
can be corrupted and usually it is not a broken drive.

I use an IBM disk on a Mega. It is from the DSAS series (540MB) and works very fine, but needed proper configuring before is started to work at all. There is (at least on my disk) a number of jumpers (beside SCSI id) which had to be set. Try to locate data for your disk on the IBM's support site http://www.storage.ibm.com (I did so for my disk).

Calamus is a TOS program (for mounting pages) it has a win version
(with embeeded emulator)
Linux is an OS
wine (Wine Is Not an Emulator) is a Linux application for running .EXE
files (windoze) without any M$ OS.

Probably somebody is interested in putting the 3 things toghether.

Sorry for the bother.

Source record: 28038

Hello!

> > Yeah, I would do that except I have absolutely no idea how to build
> > an RPM or SRPM and I looked..

That's not so hard as it looks like. Grab an existing srpm, install it
with rpm -ivh <src rpm>. Go to /usr/src/redhat/SPECS and type rpm -ba
name.spec to build the rpm. Edit the specfile for modifications, the
spec file structure should be self-explanatory (there are also lot of good
docs about building an rpm).

> Well when you find out, please let me know how to extract one or two
> files without installing. That's been on my to-do list for about...
> ...well so long I've forgotten. <g>

You can unpack an rpm easily by hand:

rpm2cpio < rpm | cpio -id

to unpack the file contents of the rpm to the current directory

Tschuess

Not only would it be easier for you to use a SCSI cd writer, but it's definately a better idea. SCSI is just inherently better and you can get older slower scsi cd writers for not too much these days.

IDE cd writer will require scsi emulation for the IDE bus and other things as far as I can tell which nobody really implemented yet, also as far as I can tell.

Thanks
Mark

I put a Toshiba drive in my Falcon and due to some wiring differences between PCs and the Falcon, the drive would spin for about a minute and go into sleep mode. I ended up swapping the drive out.

There is probably a fix but at the time I could not find one.

So in using a PC drive for a External SF314 unit, (B: Drive), would one need to leave the drive to ID1? Or does it need to be at ID0 like the internal drives???

Tim

I think that it has to be left set to A: and that being on the external connector probably makes it B: Its been sooo long since I had a two drive atari setup ;-) sorry. If you get hold of a PC floppy drive (or use try the one out of your desktop PC if you have one) just connect it to the SF314's cables (Pin 1 may be on the other side of the drive so be careful, some had to be fitted upside down), and see if it works as it is. If it does then the SF314 drive is set to drive B, if not, drive A.

I do remember fitting a switch to my STE to swap the drives from A to B and B to A. Why I did this though I cant remember.

What I can tell you though, is only the PC used the twist floppy cable method to change the drive back from B: to A:. Historically this is because when 3.5"s were introduced everyone had 5.25"s set to A: So the easiest way was to have the 3.5" come set as drive B from the factory, which was usually supplied with a little adapter that would change the 5.25" connector on the floppy cable to a 3.5" type. No twist was needed until the 5.25" drives lost popularity and stopped being fitted and the 3.5" needed to be set to A: which was impossible on some models, hence the twist method.

Smeg.

> single PC wire.

The resistance of 3 or 4 wires in parallel is lower than just one so the
voltage drop would be lower, also gives better noise immunity.
Switch to multi feeds when you can.

Hallo Don't use!

DUI>Does anyone ever manager to use an IDE atapi CDrom writer with our
DUI>computers ?

Yes. There are several listed in Anodyne's compatibility list.
Well, you've got to have an IDE port, and HDDRIVER to provide the SCSIDRV
software interface necessary to access ATAPI devices like they were SCSI, but
then you're set.
I've got one in my Milan, and can write data-CD at 10x or 12x speed with the
image on an SCSI harddisc.

I remember having troubles with a Quantum drive in the past when using
an original ICD Link adapter. It needed parity disabled and I had to
go to the Quantum site. I found a utility there that allowed me to
switch off the parity (but had to do it on my IBM system and then
install it in the Atari). If you have a smaller SCSI drive try that
and see if it works with the adapter. It's possible that the Micro
adapter won't work with that size drive.

However, a jumper needs to be switched. Many modern PC floppy drives
no longer bother with the jumper, so a cut and solder has to be done
instead. Details can be found on the web.

Are you getting just two floppy drives on your desktop ? A & B ?
If so maybe your H Drive is ok but not being recognised as you do not have a
Hard Driver program installed such as HD Driver 7. HDD7 can be obtained
from System Solutions (UK).

If the previous owner of the Falcon wiped the Hard Drive, then the
driver program would have been erased as well. You will also need
'Config.prg' to set your Falcon to the resolution,language and monitor/TV
that you are using so that it boots up exactly how you want it to
each time you turn it on.

>...- What HD 2.5" models are compatible with Falcon?..//

Below are some hard drives used by the Zetnet-Atarians. Avoid drives
made by Western Digital as they seem to give problems when connected
to Ataris. No doubt there are other drives that will work ok, but I do
not have info about them. Other members of this group may be able to
help on this.

Make Model No. Capacity.

Connor CFL420A ?
Connor CP2064 50Mb
IBM 8054 870Mb
Toshiba MK1002MAV 1Gb

>...- Is the High Density 1.44Mb PC floppy disk drive compatible with
>Falcon?...//

I believe so, but PC kit moves so fast that I do not know what the
current situation is with PC floppy drives. Other members of this
group will be better qualified than I to give advice on the current
situation concerning this. Certainly they were in the past, but in
some instances case modifications had to be made to the Falcon.

>..- Is there some good web site where I can find software/manuals for
>Falcon?....//

Yep ! Plenty ! I don't have them all at hand at the moment,but for
starters try http://jfhaslam.atari.org and follow any links to other

sites.

Good luck in getting your Falcon sorted out.

Cheers,

Paul.

Just set the drive to drive0, and off you go. Most PC drives are set to drive1, sometimes the jumper is a solder tab.

Actually the reason for the twist in the floppy drive cable goes back
a lot farther than that.

When the IBM PC computer was introduced, hard drives barely existed,
and were terribly expensive, and floppy drives weren't much cheaper.

Thus the typical IBM PC computer sold had only a single 360K floppy
drive.

Naturally it didn't take long for the new computer owners to discover
they couldn't do much with a single drive system, so they'd end up
taking the computer back to the store to have a second floppy
installed.

And of course, that was a pretty expensive proposition, having an IBM
store install hardware for you.

So people discovered they could buy the floppy drives as "spare parts"
and install them by themselves, and it was a LOT cheaper.

But---

Nobody told them that the Drive Select jumpers had to be changed to
make both drives respond properly.

So IBM started getting a lot of complaints about the "defective"
replacement floppy drive mechanisms they were selling- (and
eventually discovered those were actually being installed by users as
"B" drives, not as replacements for "A" drives as they were sold for.)

Rather than try to educate the users about changing jumpers and
things, IBM finally introduced the "twisted" floppy drive cable.

This allowed ALL floppy drives to be sold with the jumpers set to "DS1" which makes them the "B" drive. This means anyone can buy a floppy drive, plug it in, and it becomes the second drive in a two drive system, without having to change jumpers or anything.

Then by using the twisted cable, the Drive Select lines are reversed, making the replacement floppy drive also function as an "A" drive if it's needed to replace the existing drive in the computer- again, without having to change jumpers or anything.

As long as you put the drive on the proper plug, you were set. And since most computers were sold with the "A" drive already installed, it was a simple matter to just plug your new "B" drive into the only open connector on the cable, and it would work- without having to change jumpers or anything.

Tech support problem solved.

What that means of course is that ALL floppy drives sold for the IBM personal computer market have their Drive Select jumpers set to DS1, or "B" drive.

And further, since NO ONE ever changes the jumpers from "B", many manufacturers of floppy drives have simply eliminated the manufacturing cost of putting jumpers on the drives that no one is ever going to use anyway. That makes it awfully difficult for the few computer users in the world who need to have a floppy drive set for DS0 (like Atari owners).

And then of course, in the wisdom for which they're known, IBM introduced the "Master and Slave" jumper settings for hard drives.

Which are exactly the same thing they tried so hard to eliminate with the "twisted" floppy drive cable.

Go figure...!

BobR

That's not correct. The SCSI Driver included in HDDRIVER provides for
sending any SCSI command to an ATAPI device. Anodyne's CD Writer
software and other tools make use of it.

In order to access more than the first GB of a drive you need other SCSI read/write commands than those that can be used for the first GB. ICD compatible adapters support both, so it is very unlikely that the size of the drive matters. In any case you would still be able to access the first GB. If you cannot do even that something else is wrong, which is not related to the drive's capacity.

I believe they work fine on the Falcon, with HDdriver and Extendos.

Well I tried and didn't managed, so if an EIDE CDrom writer works on your TOS computer I would enjoy to have a look on your config file.

Do you know if this also applies to the internal SCSI-Adaptor of a Mega
STE ? I have indeed always been stucked to the first 1Gb of my hard
disk, which has indeed a capacity of 2Gb. Which
software/drivers/settings would be the remedies ?

Thxs!

hi,
is it worth emulating the atari st for any particular games? since i already have the amiga emulator uae i can already play rather many games that i used to own for my old amiga. however i was wondering if there are some particular games / programs for the atari st that have no equivalent for amiga or that at least are better on atari st.

For that past few years I have been using a Canon BJC2000 with NVDI

There isn't a driver for the 2000 but 2b said that any of the later BJC drivers would work. They were nearly right. It works ok in 360dpi mode but behaves a bit oddly in 720*360 dpi mode.

Let me explain. Using either the 4300, 4650 or 5500 it prints fonts perfectly but all the images in the document are printed with a double height 1:2 aspect ratio.

When I reported it to 2b they blamed the application but since it happens with every app I found this difficult to understand. What is strange is that an HTML doc printed from CAB is perfect apart from the double height images. ie. all the text is correctly wrapped around the graphics.

The BJC2000 is good in 360dpi mode, it is small and fairly fast. The only negatives are the small paper input tray and the small print cartridges which need to be refilled quite frequently. One feature I do miss from the BJ10 is the ability to put thick paper/card straight through the machine.

Regards,

Peter

Maybe because you had a single-sided drive built in and wanted to
boot off the DS B:\? That was the case with my STFM and it was
modified by Evesham Micros when I bought it to do this. It
involved swapping pins 19 and 20 of the Yamaha sound chip with a
double-pole 2-way switch.

If all else fails, it might be possible to use PC drives that can't
be reset easily to A by unsoldering (or cutting) these 2 pins and
cross-connecting them with bits of wire (i.e. pin 19 connected to
pin 20 pad on board and vice versa).

No STE's came with single sided drives, so no, that wasnt the reason.
Probably I just liked any excuse to take a soldering iron to my machine.
Either that or it was so I could multi disk games without having to swap
disks all the time.

2245. Quick MagXNet Question...

Newsgroup: comp.sys.atari.st
Date: 2003-04-29 23:28:38 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <BAD45957.2EBEE%nameerf@flash.net>
Source record: 27877

Hello!

Just a quick(?) question: What would cause MagXNet to disconnect immediately after dialing in and connecting? It's been happening about 95% of the time for the past few weeks, and I want to check to make sure I didn't do anything to change vital files. I've checked everything I can think of: all the /etc/ files, comparing them to previous discussions, example files, and discussion with Vassilis, any new programs I've installed, etc., but everything looks normal, and worked up to a few weeks ago. And *sometimes* it connects just fine and stays connected. I would blame it on my ISP (which I'm looking into switching at the moment), but both STiK 2 and my iMac's connection works without this problem occuring - leading me to think it's something on my MagXNet/OS side. I enabled the "debug" feature, and it seems that the last few things to happen before the connection is dropped is that both IPCP and LCP are "terminated at peer's request". The rest of the file I'm not sure about the meaning of. I can send this file along on your request, if it will help. Any thoughts about what else I can check? Thanks!

2246. New UK Software house for Atari ST

Newsgroup: comp.sys.atari.st
Date: 2003-04-30 02:03:17 UTC
From: "simon.ullyatt" <simon.ullyatt@ntlworld.com>
Message-ID: <D8Gra.159$NU3.5290@newsfep1-win.server.ntli.net>
Source record: 27878

Hi,

I've recently started a new software house for older computers,
and currently looking for original games software for most formats,
including the
Atari ST to market on our label CRONOSOFT. www.cronosoft.co.uk

In the past month or so, we've released four new Spectrum games, and support
has
been very encouraging. We've also been featured in the UK mainstream
magazine MICRO MART.
Read the review of our first release here:
http://www.micromart.co.uk/content/features/default.asp?Category=Article&Typ
e=&ID=1018

I understand that many users will have heavily upgraded systems, but at the
moment, I want to
allow as many people as possible access to new and unreleased games, so
would recommend
software that's compatible across the range.

We pay a generous royalty for every copy sold.

If you're interested, please email me at: chaosmongers@yahoo.com

or visit the website for more detailed information.

thanks.,
Simon
CRONOSOFT UK

Shirley you jest. The full version of Calamus is about $3,000.00.

I think it is worth every penny of that, but then I use it a lot, and have
had it for a long time, buying a bit more every year.

Jim

Who are the others? :) Remember that the ST/STE do not have a SCSI bus
but only Atari's proprietary ACSI bus. As ACSI is not the same as SCSI
one cannot expect the same features you get with SCSI. Fortunately some
of the missing features can be implemented by third-party host adapters.

The others are exactly the third-party ACSI-to-SCSI host adapters like
the ICD that you mention to work well with the extended set of commands.
And when they designed their own ACSI-SCSI interface for the Mega STE,
Atari had full specifications in hand but did not do a better or at
least equal job to the others. To their discharge and back to this time,
even a 500MB capacity was paradise.

If I remember correct, the main reason why Atari went for its
proprietary ACSI and not SCSI interface is simply that SCSI was not
fully standardized at the time of the first ST design (1983-1984).
Altough one could think at first that the temptation to go for their own
interface/standard was big, because it generates sales of dedicated
hardware in the short term. Who knows?

I still wonder what's the main difference between these ICD and the
Atari adapter, since at first sight I only saw some small signal/logic
adaptation, which has nothing to do with command redirection.

Fred

CONFERENCE ON SOFTWARE PATENTS

<http://www.europe-shareware.org/pages/communiques/
030428_conf_parlement.us.pdf>

Europe Shareware invites shareware authors and companies to take part next
May 7th & 8th in the parliamentary debates on software patents.

Mï¿œreau, 28/04/2003. During the current parliamentary work on the
COM(2002)92 directive concerning software patents, two conferences will
take place in May in Brussels.

On May 7th, a conference organized by Eurolinux, in which Europe
Shareware is an active member, will be held at the Dorint Hotel in
Brussels with many workshops including Members of the European Parliament
(MEP), experts and CEOs. Special guests include Professor Lawrence Lessig
from Stanford University, Professor Brian Kahin from Michigan University,
Richard Stallman and the Eurolinux experts in computer science, economy
and law.

On May 8th, the MEPs will organize a hearing for software SMEs in the
European Parliament. On the suggestion of Europe Shareware, Hï¿œkon Wium
Lie from Opera ASA and Thorsten Lemke from Lemke Software GmbH have been
invited to represent the shareware sector ; thus making shareware
companies one third of the panel.

We encourage shareware market players to contact us to register for these
events, so that the legislators take into account the impact of software
patentability on shareware in the final directive text.

Programme of the May 7th & 8th debates :
<http://swpat.ffii.org/events/2003/europarl/05/>

The directive text :

2256. [UPD] May Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-04-30 11:59:44 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3EAFBAB0.2010202@lutece.net>
Source record: 27887

Hi,

My software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka305.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

With this update, you will notice an important speedup
of 2D/3D drawings. This is peculiarly special with
ATARI emulators. As Olivier LANDEMARRE made me a
remark that allowed the speed improvement, I must
thanks him sincerely.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT

My 12 year old HP500 needed to be replaced, so I bought a new HP3820 printer. It does work on my Atari Falcon, using a HP850 NVDI printerdriver and with Ghostscript I can print things using the "hpdjcolor" device. 300 dpi color or 600 dpi B/W maximal I think. But it is not without problems. Once in a while the printer goes crazy, and starts spitting out pages with one or two strange characters on each page. Enough to spoil lots of clean white paper :-(

But it's better than having no prin ter at all, and it will also work on newer computers with USB interfaces.

I tried your page and had this problem, as well. While the default page shows the various languages, once you get into the actual software listings, all the descriptions are in French.

Also, I noticed that the old ESNA page URL I had bookmarked from months ago still works. Is ESNA still available for those of us in the U.S./Canada? I saw no link to it or anything from your new page (unless that's what the English page is supposed to be, although the listings are in French, and prices are in Euros).

Message-ID: <6u0sa.418892$OV.423865@rwcrnsc54>
Source record: 27896

Right now I am just seeing if anyone is interested in a trade of my stock Falcon030 (4MB RAM and 85MB HD) for a mega STE. Now, the CATCH is that I would like to trade for a Mega STE with some kind of VGA adaptor. I am short on space, and I don't want to have to deal with atari color and monochrome monitors. I would like to just use a standard VGA monitor of which i have several.

Thanks in advance

Tony

2265. ICD Product Silk Prints / Intellectual Property

I now have Tom Harkers ear over at ICD. I have inquired about obtaining the rights/property to the Atari ICD line, including the software. My problem is, he is open to a "serious" offer and I have no idea where to start. This is where you guys come in. I need input as to how much to offer Tom for his property. I guess I/we need to figure out how much he thinks it's worth compared to what I/we think it's worth and offer from there.

I have no idea what it is worth in that Atari is now a defunct computer division.

Thanks for all your input.

One of the issues with the ICD Link 1 was not knowing if it had enough
power. That is why the Link 2 has an LED to indicate that it has
power. I am using a Link 1 with a Mega2, a SyQuest EzFlyer 135, and a
5 bay SCSI chassis. Hooked up as: Mega2 ACSI -> Link -> EzFlyer 135
-> 5 slot chassis -> terminator. This has been working quite well.
However, in various configurations I have had the same problem you are
reporting, and I have had it with an ICD AdSCSI Plus as well, even
though that adapter requires a power supply. The terminator on the
EzFlyer 135 is critical! The 135 does NOT have a built in terminator
so an external one is required. Often, the lack of a terminator is
just as bad as a failed SCSI device, bad cable, or bad controller!

Source record: 27899

Hi everybody

My Falcon 1.44Mb floppy disk works, so I don't need to replace it, but my system has a strange behaviour:

- I've phisically disconnected the hard drive. I've two icons on desktop: A, B. The floppy works, read, writes and formats floppies at full capacity. Both icons works, I also loaded programs thru PC disks. The system is useable but I've not hard disk, of course, since it's disconnected ^,^.

- I've connected the hard drive (the Conner CP2046 80Mb disk) again. The drive spins up during boot sequence. After ROM TOS is started, also I've just two icons on desktop: A, B. The floppy gives an error when I tried to read or format. I've got a Language disk, but I cannot boot it since the floppy drive is not useable when the hard drive is connected and I cannot load the Hard disk driver.

Where can the problem be located?

Thanks in advance

Thanks for the reply. Well I do have this terminator on the EZ135. It has
a green led on it so I think it works. Does it matter on which connector I
put the link on? I tried either one and it does the same thing. Nothing.
If I mess with the link enough it will eventually work but then stop a
minute later. Must be the link that is bad!

They accecpt Paddles (although I've never been entirly sure what they are) and Light Guns (for shooting games) both of which are probably hard to find although Trade in Post may still have some Light Guns. They also accecpt the Jaguars Jagpad controller although not many games were written to take advantage of these enhanced ports, two of the input pins are for analog X and Y inputs which I think are used by the paddles. Most two player games will use the standard 9 pin input ports (under the keypad), because as mentioned before little software was written to make use of the enhanced ports.

A FAQ about the enhanced ports is located at http://www.gamesx.com/controldata/ejp_faq.htm IIRC it does provide information on how to construct a 4 player adaptor that uses both of these ports for one specific game but I can't remember which game, it also list some games that can use these ports although it is not a complete list as Crown of Creation for the Falcon is not listed. I found that some of the information was not always clear but it provided a useful starting point for infomation when I wanted to build my Joystick adaptor.
Using both ports together its theoretically possible to read the X/Y/Z output of an Analog PC joystick and have "force feedback" as some of the pins can be used as output (eg as used to strobe the Jagpad) although I don't know if enough power could be sinked/sourced from them to do this, I have not explored this on my adaptor as my main goal was to may it Jagpad compatable.

Does anyone have paddles and know what the circuit for them is or the output type (fixed voltage for charging a capacitor or variable voltage) as it is depends on the type of A to D converter the Falcon uses it will also enable me to know if I can use the analog outputs from my Joystick

>Where can the problem be located?

Seems to me that it's the hard drive!

All you can do is make sure that the ribbon cable is properly seated. If it's
still not working you'd have to think about replacing the drive.

There's enough space to fit a 3.5 inch drive above the shielding if you can
get an adaptor if that helps.

Cheers

Derryck

Hello,

in article <BAD5C87D.2ED29%nameerf@flash.net> (comp.sys.atari.st),
Michael and Nicole Freeman wrote on Thu 01-05-2003 01:35 (GMT):

> I tried your page and had this problem, as well. While the default page
> shows the various languages, once you get into the actual software listings,
> all the descriptions are in French.

Ah, I'm afraid you're right: the catalog is not ready for the new design.

> Also, I noticed that the old ESNA page URL I had bookmarked from months ago
> still works. Is ESNA still available for those of us in the U.S./Canada? I

Yes, it is.

> saw no link to it or anything from your new page (unless that's what the
> English page is supposed to be, although the listings are in French, and
> prices are in Euros).

Yes, the English page is the ESNA one. You can still use the "old"
pages, we will not remove them before the new catalog is online. Sorry
for the trouble.

Bye,
/Pascal/

> which i have several.

Just for your information, you should know that there are a lot of MegaSTE machines available of the market, so you better have to get a good one. What you need is one with the following features:
- Tos 2.06 (a lot of MSTE have the buggy and not practical 2.05)
- Built in SCSI card (not the infamous "MegaSTE Open" model) and hdd (can be replaced later by a 1GB drive without problem)
- 1.44 Floppy Drive (a lot of MSTE have only 720k drive, the transformation is not trivial)
If you can get one with a FPU installed, it's even better ;)

Now, for the graphic card, it just have to be any VME card that could fit a TT or MSTE. Just avoid the "SuperNOVA", because it cannot work on the MSTE. I have a Spektrum now and it works fine, I'm working in 800x608 256 colors on a VGA monitor and that's just cool.

It would be a limited market, I don't think you'd make a full time living off it, but I'm sure some $$ would flow if slowly. I know I'd like to get my hands on an ICD host now that I've got my TT back up and running.

It would depend on how deep he thinks your pockets are.

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.
---------- Forwarded message ----------
This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer!

Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives,
as-is as well as parts/incomplete SF354/SF314 Disk Drives.

Hello Tony:

I have a stock Mega-STE stored in excellent condition that could be traded.
I'm located in Michigan. I don't have a VGA adapter for it, but know of a
fellow in England that makes a $20 dongle for the monitor port that allows
use of a VGA monitor.

I would probably offer $5000 USD to start. We could probably hold a joint
payment thing and then you can own a share of ICD Atari stuff ;-)

Basically it could be a donation thing where Atarians get together to make
ICD stuff free (except for cost of hardware production, etc).

Thanks
Mark

Just my $.02

While trying out the various printer drivers with NVDI I seem to have
broken NVDI

When I started the machine this morning and tried to print from Artworx
it said it couldn't find the GDOS driver. So I tried Texel, Everest, Luna
and Papyrus. Only Papyrus would print.

I've checked the Assign.sys and the the canon.sys file all without any success.
It won't even print to an IMG file.

NVDI doesn't report any problems at boot-up. Any ideas ?

Regards,

Peter

>
> Thanks
> Tim

Tim,

To be quite honest MiNT is (in my humble opinion) quite useless on a 4 meg machine. It's something that requires a bit more horsepower as well. Even on my 16 MHz STe I found it to be slow. I found instead that MagiC was the perfect balance of speed, features and ram consumption. MiNT is more stable than MagiC (some people will bitch, argue, whine and otherwise be dicks about that statement, but it's truth). But MagiC is really cool as an OS and will make your Atari feel faster (much faster vdi and disk access), and the desktop is faster too. You can get MagiC from http://www.europe-shareware.com (or .org, can't remember). It comes with amanual but the manual might be german only - again I can't remember. The manual is unimportant. It's a simple install.

Hope this helps,
Thanks,
Mark

Hello,

I tried to email but yahoo rejected.

Here is my post:

Hello,

I'd love to get my hands on a Falcon.ï¿½ I have a stock of Atari stuff.
Unfortunately while I have _3_ Mega STe motherboards I have no official
Mega STe cases.ï¿½ I have several keyboards, etc, mice.ï¿½

This is what I can give you.ï¿½ My Mega STe that I have custom mounted in
a sun photoprocessor tower case.ï¿½ This machine will include an AlberTT
VGA video card with adapter for 15 pin VGA.ï¿½ This card does 1024x768x16
colors.ï¿½ It's alright but fairly slow.

Also included is the adapter that I installed directly to the
motherboard a long long time ago.ï¿½ I have a VGA adapter that consists of
a VGA plug and wire soldered directly to the motherboard.ï¿½ This allows
the use of mono video mode but it isn't wired for color (medium and low
res), and rightfully so as most vga monitors can't support the rates
provided by st low and medium.ï¿½

Also included is the ICD Link 2 special edition currently going for over
$100 on eBay US right now.ï¿½ It comes with a several hundred meg hard
drive (540 meg I believe?) that has MagiC and some other stuff installed
on it.

The machine has 4 megs of RAM, which is the max without a Magnum card,
and it has TOS 2.05 with the 720 K floppy.ï¿½ I've tried to install an
AJAX chip to get 1.44 meg but the chip was bad.ï¿½ï¿½ I believe there's also
a zip drive I would probably toss in with it.

This is all installed in a huge tower case.ï¿½ I'm talking castor wheels.
If you wanted I could try to remount everything into a smaller case.ï¿½ I
could also make a mono/color switch and mount up two separate cables for
color and mono through vga.

Honestly, you might find someone who has a better mega ste to trade with
a better vme video card, and tos 2.06 with 1.44 meg fdd but this is what
I have to offer.ï¿½ Let me know ;-)ï¿½ I already have a Falcon so I won't be
heartbroken if I don't get it.

The manual (of MagiC) is in French if you buy through Europe Shareware.

Tim

Is the light on the terminator or the front of the EZ135 drive? If
it's on the drive it has no relevance to the terminator/Link.

Since 'messing' with the Link seems to make a difference, you may have
some cold solder joints on one of the connectors in the Link. You
could try to pry open the clam shell of the unit and check the
condition of the solder between the PCB and the pins of the
connectors. If anything looks cracked or broken use a low power
(20-30w) soldering iron to fix the joint.

Donald

Try www.ebay.com! I recently bought an Atari ST Mega 2 w/color
monitor for $82 (plus another $25 for shipping from Canada to Los
Angeles). I have seen a number of Ataris for sale and often bid on
them. Just decide what you want, what you are willing to pay, and bid
on units that meet your needs till you finally win one. (I was
actually quit suprised to win the unit I did for the amount I paid,
but that is the beauty of eBay!)

Larry

Proving my point all along that you have the mental capacity to know what
is right and wrong and how to address your customers - or perhaps possible
customers. Also you have the ability to do other work to supplement your
atari business so that people don't have to feel sorry for you and make an
exception. That's all. Plus there's good medication for bipolar
disorder. I know people who are on it.

Thanks,
Mark

I've recently resqued seven (!) old Macs from being thrown away at work. They're all Performa 475 with 8Mb RAM and 250Mb disks. They also have ethernet cards and OS 7.5.1. I've upgraded one of them with 20Mb RAM, a real 68RC040 and speeded it up to 33MHz. It's actually quite usable now, especially as it was really easy to get it networked (I'm writing this on the Mac).

It would be cool to run MagiCMac on it, but which version is best suited for this ancient machine? And would I be able to access the network through MacOS (MacTCP)?

So there are Shareware only? What all are freeware?

What are the limitations of shareware? I am not looking to spend money
right now until I find one that I like, and that is in the English Language.

Thanks

You need a package called "stip" that does just that with iconnect, but
if I recall correctly it is not free. I can't remember were to find it.

I have now a good running software configuration on my CT60.
Didier did a very good work !

I did some tests with the old and known POVBENCH and the script
SKYVASE.ORI
This gives 21 min : 36 s. with the 060 at 66 MHz + 64 MB of SDRAM.

I remember a old file with several tenth of tested computers and results.
Here I have only the F30 + CT1 & CT2
CT1 : 4 h 58 m 28 s
CT2 (a or b ??) : 2 h 6 min 36 s

There is a factor 6 with the CT2.
and 14 with CT1 (030 at 25 MHz).

With GEMBENCH 4.03 + NVDI 4.11 R3 :

GEM Bench v4.03 © Ofir Gal - 3 March 95

2299. CT60 TESTS

Newsgroup: comp.sys.atari.st
Date: 2003-05-01 21:27:03 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3eb19126$0$10108$626a54ce@news.free.fr>
Source record: 27931

I did some tests with the old and known POVBENCH and the script
SKYVASE.ORI
This gives 21 min : 36 s. with the 060 at 66 MHz + 64 MB of SDRAM.

I remember a old file with several tenth of tested computers and results.
Here I have only the F30 + CT1 & CT2
CT1 : 4 h 58 m 28 s
CT2 (a or b ??) : 2 h 6 min 36 s

There is a factor 6 with the CT2.
and 14 with CT1 (030 at 25 MHz).

With GEMBENCH 4.03 + NVDI 4.11 R3 :

GEM Bench v4.03 © Ofir Gal - 3 March 95
==========
Falcon 030 TOS 4.04
AES v3.40
GEMDOS v0.48
MiNT not present
Blitter Disabled
NVDI 4.11 present
Video Mode: 640*480*16
FPU cookie value=$A
Run and Malloc from FastRAM
Ref: F030 + FPU, 640*480*16

2300. Re: The Link 1 SCSI adaptor problems

Newsgroup: comp.sys.atari.st
Date: 2003-05-01 21:54:10 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vb35s39u09790a@corp.supernews.com>
Source record: 27932
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

So what is the issue with not having enough power? Does this involve the terminator or is that something else? So what can I do to make sure there is enough power?

Thanks
Tim

The Mega STe internal adapter is just plain weird.

If you want to boot from an external hard drive as ID 0, with the internal
as the second in the chain you have to set the ID of the drive to 0 as
well otherwise the HA won't recognise it and use the dip switches on the
HA to designate the SCSI ID.

And it doesn't end there, oh no... B^<

> Luna and Papyrus. Only Papyrus would print.

Depending how you've set up printing, Papyrus can use it's own drivers
rather than NVDI. This continues to point to an NVDI problem.

> I've checked the Assign.sys and the the canon.sys file all without any
> success. It won't even print to an IMG file.
>
> NVDI doesn't report any problems at boot-up. Any ideas ?

When you say this do you mean no on-screen error messages? NVDI will
control screen drivers as well, so I don't know what happens if
something has already gone wrong. Do you have redirected graphic
output, such as with a graphics card? In that case the error message
will be routed through the normal monitor port (I never see an error
message on the TT for that reason). Does one of the NVDI CPX's help at all
- the Printer.CPX might have been changed or corrupted?

Do you have the NVDI logfile set up? If not, set it up in C:\NVDI.INF to
log to a file (eg logfile = C:\NVDIERR.TXT) and see what clues get posted
in there. This might give you the biggest clue where things have gone
wrong.

> - Tos 2.06 (a lot of MSTE have the buggy and not practical 2.05)

This is a bit harsh. A couple of patches, or simply having MagiC installed
makes up for any shortcomings in the TOS version. I'm not sure if TOS 2.05
also indicates having only a double sided floppy rather than HD floppy but
otherwise it's not insurmountable. (I have a spare TOS 2.06 MSTe somewhere
and a TOS 3.01 TT with Magic - no probs either way).

> - Built in SCSI card (not the infamous "MegaSTE Open" model) and hdd
> (can be replaced later by a 1GB drive without problem)

I can't believe there are MSTe's still around without a hard drive, can
there?

> - 1.44 Floppy Drive (a lot of MSTE have only 720k drive, the
> transformation is not trivial)

Yes, it usually needs an updated FDC as well as the floppy - not many
chips left when I had my TT upgraded at Atari workshop a while back.

> If you can get one with a FPU installed, it's even better ;)

Irrelevant IMO. So little software uses it. Positive Image is supposed to
have a version compiled for the FPU and it makes no difference whatsoever.
Only very few programs made any use of it an they've been unavailable for
years. Am I wrong?

> Now, for the graphic card, it just have to be any VME card that could
> fit a TT or MSTE.

For an MSTe it's the _only) option for using it with an SVGA monitor.

> Just avoid the "SuperNOVA", because it cannot work on the MSTE.
> I have a Spektrum now and it works fine, I'm working in 800x608 256
> colors on a VGA monitor and that's just cool.

Finding _any_ VME graphics card is tricky. Note, though, that it _demands_ the use of NVDI, makes non-GEM programs unusable without reverting to the original monitor output and monitor (colour or mono) and slows the graphics display by an enormous amount.

What version are you using? Under NVDI4 I switch printer drivers with a .CPX.

Not much, actually. There's the LINK2, which could be put back into
production, but the ICD utilities probably won't sell well against
HDDriver. There's also Aircars and the Catbox, of which the latter
would still have a market. Are there any other ICD items still
viable?

Think about production costs of 100 units of hardware and subtract
that from your retail price. Then figure how many items you expect to
sell over your business/hobby's lifetime. It makes no sense to pay so
much you have a net loss, and frankly, I don't think you'll be able so
sell much more than a couple hundred of each item tops.

Off the top of my head, I'd say the intellectual property is worth a
few (1, 2, or 3) thousand US, and the physical ready-to-sell inventory
worth 35 - 50% of retail. Harker will almost certainly WANT more than
that, but technology has a finite life span, and often even a life's
work is only worth a few hundred dollars a decade later.

Hello,

in article <vb304snbrug923@corp.supernews.com> (comp.sys.atari.st),
Tim wrote on Thu 01-05-2003 13:16 (-0700):

> So there are Shareware only? What all are freeware?
>
> What are the limitations of shareware? I am not looking to spend money
> right now until I find one that I like, and that is in the English Language.

I'm not sure to understand you correctly, or maybe you didn't understand
me nor know Europe Shareware.

We are a non prorit organisation.
We are based in France at the beginning, then North America and Spain
joined us.
Our main goal is to promote shareware and to be an easy way for the
users to pay the shareware fee, as did previously some other
organisations (Joe's and Dennesh's ones, if you remember).
An other goal is to fight against software patents in Europe (a very
important topic for the whole community of programmers).

With the lack of Atari dealers in France, we also decided to sell some
famous applications like the one from Anodyne (CD Writer and ExtenDos),
ASH, Invers (Porthos and Calamus Lite, that are shareware in fact).

But about MagiC and other ASH applications, we do not own the rights on
the English docs (System Solutions usualy does, translations done by
excellent team DDD).

Next question? :-)

Best regards,
/Pascal/

Hi Jo Even,

I believe that any version of MMac will work on a Performa/Quadra
provided you run Systems 7.5, 7.6, 8.x, 9, or 9.1 (not 9.2 or X).
Grab a copy and give it a try!

I don't know about the network -- I think so, but I've never networked
my Mac (it's on my to do list).

At least one drive on a SCSI chain is meant to provide TERMPWR (termination power) to it for the termination to work. The Link uses this as well to power itself from. I doubt very much if that's the cause of your problem and would go through the other problem-solving routines that have already been suggested.

Cheers

I know of at least two people who are running MagiCMac under OS9.2.2, not even a patch needed, and MagiCMac for OSX isn't far off if it isn't out already.

>I don't know about the network -- I think so, but I've never networked

At the moment there are no drivers to allow access to the Mac's Ethernet port from MagiCMac.

That will only allow you to use the Mac's diallup routines for the purposes
of using IConnect clients under MagiCMac - so no networking I'm afraid.

I'm of the impression that the stip of which you speak is already part of the
Mac OS, but I'm very willing to be proved wrong here :-)

>The manual (of MagiC) is in French if you buy through Europe Shareware.

FWIW DDP Translations furnished Atari Workshop with a full English release of
MagiC 6.20 late last year. I don't know what El planned on doing with the
manual though.

Cheers

> Sundog, Super Sprint, Colonial Conquest for instance.
> And probably many other I forgot.

MidiMaze, Xenon 1, most MIDI programs, Calamus & Papyrus (amiga has MIDI programs but most of they looks more like Playskool toys than serious applications, and desktop publishing solutions mostly sucks)

> and a TOS 3.01 TT with Magic - no probs either way).

Not that harsh, just realistic.
A lot of small programs that extend the tos functionalities does notwork
under version 2.05 of TOS (ex: ColorTOS to get colored icons on the dekstop,
quite nice when you have a graphic card), you don't have the memory test at
boot (ok, that's useless anyway), but you cannot boot the system on the
harddrive with AUTO folder disabled (that key combination to do that does
not work on 2.05).
You can leave with a Tos 2.05, but that's better with a 2.06.
You can have a HD floppy drive with tos 2.05, I know I have a 2.05 tos and a
HD floppy on one of my MSTE ;)
Another urban legend I guess.

> > - Built in SCSI card (not the infamous "MegaSTE Open" model) and hdd
> > (can be replaced later by a 1GB drive without problem)
>
> I can't believe there are MSTe's still around without a hard drive, can
> there?

Some use an external SCSI HDD with external DMA<=>SCSI interface. It works,
but it's clumsy to get so much wires outside the box when you could have it
INSIDE the box :)

> > - 1.44 Floppy Drive (a lot of MSTE have only 720k drive, the
> > transformation is not trivial)
>
> Yes, it usually needs an updated FDC as well as the floppy - not many

> Irrelevant IMO. So little software uses it. Positive Image is supposed to
> have a version compiled for the FPU and it makes no difference whatsoever.

> Only very few programs made any use of it an they've been unavailable for
> years. Am I wrong?

Not wrong, but programs compiled with some compilers (Pure C ?) will
automatically switch to FPU when it is detected. Can be interesting if you
want to use POV or other 3D/maths programs. I guess it must also help when
using Calamus ?

> > Now, for the graphic card, it just have to be any VME card that could
> > fit a TT or MSTE.
>
> For an MSTe it's the _only) option for using it with an SVGA monitor.

You can also make the VGA modification for the standard monochrome mode.
It's a hack but it works.

> > Just avoid the "SuperNOVA", because it cannot work on the MSTE.
> > I have a Spektrum now and it works fine, I'm working in 800x608 256
> > colors on a VGA monitor and that's just cool.
>
> Finding _any_ VME graphics card is tricky.

I know, it just takes me 3 years to find one ;)
And it was the wrong one: the Super NOVA.
But at least I had an interesting exchange product. I trade it vs a Spektrum
True Color card with a TT owner.

> Note, though, that it _demands_
> the use of NVDI, makes non-GEM programs unusable without reverting to the
> original monitor output and monitor (colour or mono) and slows the
> graphics display by an enormous amount.

Of course if you try to use it without nvdi, in huge resolution, it will be
slow. But 640x400 in 256 colors is usable even without NVDI.
But when you get NVDI, everything is ok, no more slow than when using normal
ST resolution.
And in the case of spektrum card, the RGB monitor is still available and is
able to display without problem the non gen programs and demos. I suppose it
all depends of the type of cards and drivers.

Here are the links for POVBENCH :

General :
http://eureka.atari.org

060 versions - direct link :

http://eureka.lutece.net/pov31g60.lzh

For the vase:
http://www.haveland.com/povbench/skyvase.pov

Please, if you do some tests, specify the OS (TOS, MAGIC, ...),
On CT60, it seems that with TOS the results may be better than with magic.

Regards

Message-ID: <1051896578-455136AEicMi@xs4all.nl>
Source record: 27801

Is anyone familiair with the brand: Optima technology? I just
bought a CD-R writer on an auction for nothing more than half an
Euro so it's no pain if it's full crap but somehow the machine
sems to be o.k. accept that it is somehow bad or wrong
terminated. When attached to my TT the computer fails to boot
and stops with the screen saying: Magic Booter version so-and-so
and freezes.

Has someone any suggestion? It seems to be a SCSI device.
There is a green light at the back that lits up when you put it in a
chain. I thought that there are only a few producers of these
writers and that they should somehow also functuion on 'our'
Atari's but nonetheless this one seems to fail the test.

Any help?

If its just for MIDI then any atari ST will do. You should be able to come across one in either a second hand paper or a used store. Maybe £10-30 ($15-50) for an STfm, maybe slightly higher for an STe.

You dont need any upgrades for Midi work but you *should* get a machine that has got 1Mb in it (any 1040, or upgraded 520 is fine) , but if you find a half meg STe you can upgrade it to 4Mb youself pretty easy (30 pin simms). Be aware that some music softwares will only work on bog standard machines (ie not accelerated, or have a strange OS), so you are better off getting a machine that hasnt been "tampered" with.
Also, most music software needs hi-res so that means an Atari SM124 monitor, which can be at least as much money as the ST. There are extra midi ports available if you need them (you can make an extra Midi Out for a couple of bucks).

snip.

I think you could sell quite a few of both aircars and catboxes. These pair
are still the rarest Jaguar items that are most commonly sought after. I
spent 2 years trying to get a catbox and then gave up. (Does anyone have one
to sell me btw??? :-)

Smeg.

2329. Re: Joystick port compatability

Newsgroup: comp.sys.atari.st
Date: 2003-05-02 18:05:44 UTC
From: Tom McEwan <tom@tnmcewan.fsnet.NOSPAM.co.uk>
Message-ID: <b8uc20$g37$1@news8.svr.pol.co.uk>
Source record: 27806

Does anyone know of any configuration/diagnostic utilities for the enhanced ports? I couldn't get hold of an authentic Jag pad, so I built one instead, using a joystick from an arcade machine, a telephone keypad and a few other odds and ends. I'm certain I got the connections right, but only a few buttons (buttons a, b, pause and opt, to be exact) seem to work properly, and I don't know whether the problem is software or hardware. Any suggestions? I've checked the port with an oscilloscope and the polling pulses seem to be present, but that's all I've been able to verify.

Tom

Also, does anyone know of STE software that uses the light gun? Or can someone perhaps tell me where to find information on how to build one?

I remember there being a demo with the word "fuck" (not a word I like, but... I know one demo I had that had that word in it) in it, that, I think had weird multi-colored things going one while there was this silloette of a girl dancing or something. It was a rather interesting demo, but I don't recall what it was called exactly. I believe it was for the Falcon030.

Anyone remember it? I doub I have it (or that it would've fit) on any floppy of mine...

A Milan060 is nearly two times faster than a Falcon with CT60 ?
What would be the technical reasons for this ?

Some of you may not have noticed, but the Adamas browser is still being developed, quite actively lately, and is freely downloadable these days.

Adamas has been critisized a lot in the past in this newsgroup, but Jens Heitman deserves our support for not giving up on this browser. While CAB's development has stopped, and Highwire still has the "very promising" status, Adamas latest pre-release versions show several improvements. I have been trying it with MiNTnet/mgw and it works pretty good. For javascript support it's still without competition on the Atari platform, even if it's not perfect.

Have a look at http://draconis.atari.org.

I don't know. The Milan runs the '060 at 2:1 mode - ie. bus clock is
25 or 30MHz, and the EDO DRAM is not the fastest.

I am not sure about the CT60, but assuming it runs the CPU at 1:1 bus speed
and uses SDRAM, it should in theory be noticeably faster than a Milan.

>
>Regards
>

Thanks for that Rodolphe.

I haven't used POV for years so I ran it through an old copy of POVshell.

Here are the results for a Milan060 at 50MHz using Mint 1.15.12

Time For Parse: 0 hours 0 minutes 1.0 seconds (1 seconds)
Time For Trace: 0 hours 1 minutes 12.0 seconds (72 seconds)
Total Time: 0 hours 1 minutes 13.0 seconds (73 seconds)

I ran it three times and got near identical results.

If I was to move the jumpers to clock it at 60MHz I would expect
a 20% speed increase, roughly.

Regards,

Peter

I'm not sure your criticisms are valid. I'm sure either ICD or HDDriver provides the boot without Auto folder facility. My TT's TOS is 3.01 (less capable and more buggy than 2.05) and with MagiC\Magxdesk I have full colour icons on the desktop and all TOS errors fixed. HSModem provides belt and braces fixes.

I think you just need to use better utilities!

> could have it INSIDE the box :)

Of course it's not quite as neat, but with the shortcomings of the internal host adaptor discussed earlier and the fact that no ICD host adaptor was ever made for the Mega STe (only the Mega ST) sometimes it's the best option for HD expansion. Like I said elsewhere, I chose to use my old external drive as my boot drive.

Again I can't agree. Scrolling a window (GEM compulsory, remember) on a TT in mono 640*480 with Magic, NVDI and a Crazy Dots 2 graphics card is way slower than using an STe with a mono monitor and the same program. No contest. The benefit is the colour and screen real-estate - don't even think of a graphics card for speed.

> And in the case of spektrum card, the RGB monitor is still available
> and is able to display without problem the non gen programs and demos.
> I suppose it all depends of the type of cards and drivers.

Out of interest, what's the non-GEM program you're using? Unless you run it in a window there's often problems writing to random parts of the screen...

I just downloaded it to and got some sort of option file error.
After much fiddling, I renamed skyvase.pov to object.pov and tossed it,
povray.ini, and the pov binary into the include directory. Drop the
ini on the binary and it took off. I tried setting the include path,
it seemed obvious, but it refuse to work. I manage to get it to work
this way and got a result of 3 mins and 25 secoonds on my hades060.
I had irc going, and I loaded the huge povray doc and was scrolling while it
rendered. Probably could do better if I sat still. ;-)

2338. ICD The Link, how does it normally work?

Newsgroup: comp.sys.atari.st
Date: 2003-05-02 22:59:39 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vb5u2s3eerkj47@corp.supernews.com>
Source record: 27815
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I need to know how the Link normally works. I have one that seems to not work but I am not sure if it is due to bad termination or power problems.

When the Link is connected to a DMA port via DMA cable, and the ICD Tools disk is loaded, should it say Host Adaptor not found? Or should it list the Link? I get host adaptor not found. Also what tools on the disk can I load to tell me the link is working properly? I don't want to buy another one if this one is working ok and I am just being dumb somehow!

I have a EZ135 and a terminator with a LED on it, so it should be terminated ok. I also tried a Quantum 810MB SCSI HD in a SCSI Enclosure.

Thanks for your help,
Tim

HDDriver is a commercial product, I don't necessarily want to pay for
something I can get for free (AHDI).
All the theory about greet products like "magic" is nice, but I generaly
need the ability to skip the auto folder when I'm installing new things.
When I was "playing" with the installer of the card SuperNova, and then
later Spektrum, I've been obliged to boot on a AHDI floppy numerous time
because the boot sequence was fucked up... run AHDI.PRG, show icons, get C
drive, remove faulty program, try again... blahhh.

I have heard that the Link exist in a special MegaSTE version that you can
exactly put at the same place than the original card made by Atari.
Personaly I didn't get any problem with the internal adaptor. I have a 1Gb
Micropolis drive on it, and it works fine.

I never get a mono monitor, so I can't say anything about that. I just can
say that Devpack in 640x200 4 colors on the RGB is not a lot faster thant
640x400 256 colors on the Spektrum card, with or without NVDI. Simply
perhaps because that the Spektrum driver that do the graphic operations ?

Only fullscreen things. For me a "non gem" program that support windowed
modes is only a "badly written GEM application" ;)
Last things that ran without anyproblem was the last sound demo of the
YmRockerz: "PopStars".

The installer usually doesn't work for me, however this time it did. I
tried under aranym. the Gethostbyname isn't working so the browser won't
load for instance www.google.com. I can however point it to an IP but then
it freezes on loading images. The basics aren't done.
Course i was using mgw-024c which was meant for MiNT 1.15, I actually have
1.16 alpha but 031b won't work for me at all. Seems like a great idea, but
how come I can't get it to work on a variety of platforms and situations?

The Link needs terminator power from the scsi bus in order to work. Not a whole lot of drives out there provide this and even more of them need to have a jumper switched. My Link has a small LED right where the "i" is in link to let me know it is powered up. If this isn't on, it isn't receiving termination power (which it draws on to power the host adapter). Without power the host adapter might as well not be there even though it might very well work. I'd check on this... It's probably what the problem is.

Termination is not that big of a deal, you'd probably detect the drive but get strange errors. At very least the link would be found.

Thanks,
Mark

Hey, Thanks for the input....

I don't think the proposal would include those boxes even though they could be in demand. I'm afraid Mr. Harker is going to want more than I am willing to part with. My purpose for this was to try and provide those quality components to those of us that can't find them. I surely don't want to go to the poor house in the process. I don't know why they don't just manufacture a smaller amount of these and sell them bulk to this or any other Atari newsgroup that requests them. They are already tooled for product. I'm sure they could easily sell in the hundreds of these. Not really alot of product in todays market, but, for an old technology, it's not bad.

Here are my feelings on this...

I would rather someone go to WB Systemtechnik and try to buy the rights of the Link 97. It's a much better SCSI host adapter that supports SCSI initiator and arbitration so that the Daynaport SCSI Ethernet adapters can work. Or maybe someone should just design a new SCSI host adapter and bypass this process.

Aircars might be interesting, but it really wasn't a good game. Plus, I believe ICD only distributed it and Midnite Entertainment were the authors. Midnite should be the ones to go to to ask for another production run.

Catboxes aren't needed anymore. The Scatbox does a great job to replace it. I don't think the missing headphone jack is a big deal.

Lastly, I don't trust Tom Harker. That slimebucket still has not delivered the Catboxes that people prepaid him for. This asswipe might pull another one again.

If you go through with this, make sure you know what your are getting. Look at all the papers, drawings and stuff to make sure you have all the information you need to build the Link 2s BEFORE you plunk down the $$$. (I am assuming you have excellent knowledge of the ins and outs of the Atari ST so that you can check this) Who knows, he may "forget" to include a crucial piece of information and then disappear again leaving you with half-baked information. Make sure to ask for collateral (I suggest his house) in case he does this. (I'm serious too) That way, if the asshole tries to screw you and the Atari community again, he's going to be homeless. Then you can sell the house and use the $$$ to hire someone to design a new SCSI host adapter. :-)

I'm sorry if I sound harsh and pessimistic, but Mr. Harker's past screwings still bugs me. I'd rather not deal with him, and go to the Germans to see if they'd be willing to make a new production run of Link 97s.

Just my $0.02 worth...

Iconnect only does dialup, so that is a logical conclusion. I forgot about
that.

> I'm of the impression that the stip of which you speak is already part of the

I have 9.2.2 on my mac but never ran across anything called stip on the HD,
but you never know, there's a lot of stuff thrown in there. ;-)

sorry but you can networking with macstip/iconnect and use ethernet port on
the mac on a network, you have to conf your network under macos
macstip bypass the dialup and use the macos network conf

working exemple :
internet < dsl > pc xp pro < ethernet > mac (macos8.6 + macstip) ..
magicmac
(iconnect / ifusion)

this conf work without any problem

ps: macstip don't work on macos >9.* , 8.6 max for use it

You can buy an English manual and MagiC program from Atari Workshop
info@atari-workshop.co.uk. They should have the latest 6.20 version.

I disagree with a previous post about the manual not being of much
use. There are some features that need the manual, specially if
you are not familiar with the program and associated sub-programs
included with the bundle. I feel the manual could be a lot better
than it is, but that's another matter...

ALso Oids! That was excellent.

Actually Xenon 1 was out first for the Amiga and was much better..

Hi,

I've been looking for the name of this game/demo whatever it is for the past oh I dunno 5 years or something. If anyone knows what it is called or can post a binary, please let me know. It is an overhead isometric view game where you can control some trains. I believe it is a model train layout. The game isn't: A-Train, Railroad Tycoon, or Transartica. It may have been freeware or some demo software.

Thanks

Ok.
I was sure that Xenon 2 - MegaBlast was first on Amiga, but that Xenon 1 had been released only on ST. Thanks for correcting.

I never understood why the Atari market has declined so much...
...oh yes, it was because of statements like that.

Tell me, how would you get a MSTe with a graphics card for free? Sheesh...

If you want a free program, we've already heard that ICD software will
work the Atari host adaptor, is free (but without support) and allows you
to boot bypassing the Auto folder. The TOS problem you describe is now
irrelevant again and at a price even you can afford.

> When I was "playing" with the installer of the card SuperNova, and then
> later Spektrum, I've been obliged to boot on a AHDI floppy numerous time

Software problems and graphics cards is a big problem area when things
start to go wrong. Especially when the INF file gets screwed up - in
the past I've been locked out for up to 30 re-boots at a time and I
haven't seen 16M colour mode for three years! B^)

>> but with the shortcomings of the internal host adaptor discussed
>> earlier and the fact that no ICD host adaptor was ever made for the

This happens alot to me when iI used a dial-up ISP. I was not
using MagicNet, but was under Magic and using STiK2. This started
to happen when my ISP merged with a larger company. After that,
servive was terrible along with problems with connecting and
staying connected. I would be downloading/uploading browsing and
my connection would just go bye-bye. I think it is your ISP.

Hey, I'm not talking about PIRACY !

AHDI was free so far I know, I get it with my Falcon 030 years ago.
If AHDI failed in my case, of course I would have looked for something else,
but since it worked fine I don't see why I should upgrade. As people said
"if it isn't broken, don't fix it".

I prefer to spend money for the things I _really_ need.

I've got the problem when I tried to install a card in my 10 mb MegaSTE...
seems that no card want to work in this machine because of some hardware
conflict, but well... have to reboot quite a lot of time.

Jens has recently installed Aranym, and will also use this for testing.
Things will improve. And he doesn't mind getting bug reports. He has
responded on my bugreports quite quickly with new releases.

> Course i was using mgw-024c which was meant for MiNT 1.15, I actually have
> 1.16 alpha but 031b won't work for me at all.
That's true. Jens is aware of that but hasn't found the problem yet. The
sources are available (Freemint CVS) so if there is anyone who know how to
fix the newer mgw, he will be welcomed.

> Seems like a great idea, but how come I can't get it to work on a
> variety of platforms and situations?
My point is: anyone who is willing to put a lot of time and effort in
creating a better and free browser for the Atari platform deserves our
support. Highwire or Adamas: a little competition won't hurt.

It might be because I haven't used POV for years and I rendered
a smaller image or something odd like that. Maybe POV shell
over-rides the script file image settings ?

It created a 160x100 TGA image of 48018 bytes. I don't know what
the image size should be.

Sorry if I have just confused matters.

Regards,

Peter

Ok I tried the skyvase again but this time used the command line ttp and the
parameters from the POV Bench website:

-i skyvase.pov +v1 -d +ft -x +a0.300 +r3 -q9 -w640 -h480 -mv2.0 +b1000

This took exactly 30 minutes so I suspect that this isn't right either.
Does anyone have the correct .ini file ?

Peter

What HD Drver software works with the Falcon's IDE? I will be getting a
Falcon soon and want to know what software I need to be on the lookout for.
I also have some 2Gb and 4Gb HD's. Is there a limit on 2.5" HD's sizes for
the falcon?

I think I have a Toshiba 2Gb HD in my Amiga 1200 I can swap if a 4Gb IBM
will not work in the Falcon.

Thanks!
Tim

Hi peter, I have tried again with the same command line under MCMD and
MagiC:

Time For Trace: 0 hours 14 minutes 1.0 seconds (841 seconds)
Total Time: 0 hours 14 minutes 1.0 seconds (841 seconds)

CT60 66Mhz.

With the the correct .ini file I obtain 2 mn 47 (TGA output 320 x 240).

Regards,

Didier.

>A+
>
>Jean-Marc
>"Sorry for my frenchenglish ;)"

Thanks Jean-Marc. No problem with the language.

Using the proper ini I now have:

Time For Parse: 0 hours 0 minutes 2.0 seconds (2 seconds)
Time For Trace: 0 hours 5 minutes 44.0 seconds (344 seconds)
Total Time: 0 hours 5 minutes 46.0 seconds (346 seconds)

which is good but nothing like as good as the CT60 which seems to
be a little over twice as fast as my Milan !!

If only my SCSI card would work at 60/30MHz, it used to when I had
the 68040.

CT60 66MHz 2'47"
Hades060 3'25"
Milan060 60MHz 3'45"
Milan060 50MHz 5'46"
Milan040 25MHz 8'30"

I am not sure why my run was so much slower than Jo-Evens Milan060/60
We are both using Mint/NAES.

Regards,

Peter

I use 2 very good filters and a virus checker already, it's just a
piss in the wind if you ask me.

But, sadly it's just making the group more pointless and unreadable.

I've read this group for many many years, actively helped many and
think of myself as a regular and good group person yet this person who
knows me and I know him feels the need to ruin the fun by making the
group stagnate just to prove that him and his mates have some little
hint of power.

What power?

The power to post via Dizum...Whoopie....very manly.

The power to mailbomb..very old school

Nope, it's just the power to ruin a group with childish stuff making
readers clear off in droves.

Nice one S.....You might just win and fuck the whole group up, you
must be proud.

<sigh>

Hi!

Égale, the file comparison program, is now freeware, using a public registration key. The latest (and last) version, 4.1, adds long filename support and has several other improvements. A full English bundle, prepared by xlator of DDP Translations, is now available from author David Reitter's webpage:

www.reitter-it-media.de

For those who don't know the program, besides comparing two text or binary files side by side (to allow changes and additions to be seen easily) Égale can also compare complete directories or even partitions (useful for checking if a copy or backup is intact), produce directory listings (including folders and optionally show various file data) and also it can be used as a binary editor.

Regards, /Peter/

>> now irrelevant again and at a price even you can afford.
> Hey, I'm not talking about PIRACY !

Neither am I, please don't think that. I'm saying that even when someone persists with Atari as a user in a market that has been declining for as long as it has, when there have been so few people left developing for the platform, the refusal by users to pay even a small amount for support to remaining developers\suppliers has meant they can't work solely in this market. The result is what we've already seen.

You'd like a fix for TOS shortcomings (provided in Magic), driver shortcomings (provided in ICD and HDDriver), colour icons (provided in MagxDesk\Jinnee and many other desktop replacements), graphics card support (provided in NVDI) but seem to want to fight only to refuse to buy any of them and thereby discourage developers to stay.

I know you're not asking for pirated software - your asking yourself to continue to suffer while an available solution exists. You suffer, the developer suffers and then we all move on to other platforms. No winners.

> AHDI was free so far I know, I get it with my Falcon 030 years ago.

>
> I prefer to spend money for the things I _really_ need.

But you said you can't boot without the Auto folder, so it _was_ broke. Answer = ICD\HDDriver. The ICD drivers fix was _always_ a free download since the release of the MegaST. HDDriver has always been about half the price of ICD Pro utilities - a very low priced product.

>>> When I was "playing" with the installer of the card SuperNova, and
>>> then later Spektrum, I've been obliged to boot on a AHDI floppy
>>> numerous time because the boot sequence was fucked up... run AHDI.PRG,
>>> show icons, get C drive, remove faulty program, try again... blahhh.

Drivers supplied with cards have always been rubbish. NVDI has always been
the most integrated solution, even if they have caused problems of their
own.

>> Software problems and graphics cards is a big problem area when things

I'm surprised. The VME was a standard port - unless you used a card that
preferred the port used on the MegaST, which was very different and
incompatible.

I already leaved the Atari platform in 1995 seeing that nothing evolve,
Atari screw up with the 16bit bus on the falcon, had put all his resources
in the Jaguar thus killing the Falcon 040, bla bla bla...
I'm back on the Atari only for nostalgia, not for doing serious things. I'm
impressed by some hardware/software configurations around there, but don't
count me as a serious Atari user. That guy just ask about a MSTE and I tell
a list of criteria that should be watched, nothing more.

I don't know exactly what kind of memory expansion this is. I have some
small programs to choose between memory or blitter, so I either have a 4
megs MSTE with blitter, or a 10 megs MSTE without blitter. Unfortunately I
cannot get the VME cards to work in any of these two modes, so I'm stuck,
obliged to use my 4megs 720k MSTE instead of the 10megs 1.44m one :(

>will not work in the Falcon.

Hi Tim!

The best one is HDDRIVER, and though it's commercial, it has some features not offered by other drivers.

The maximum disk size that you can fit is (almost) unlimited, but the maximum partition size depends on the OS, not the driver. The upper limit with TOS 4.x and MagiC is 1 GB/partition (32766 clusters with 32768 bytes each). Thomas Binder says that larger partitions (up to 2 Gig) seem to work with TOS 4.0x, but it's not recommended as there are problems in TOS which may cause serious problems. Older TOSs have a maximum partition size of 512 MB, though larger sizes are possible with BigDOS.

I have a 6.4GB IBM DTTA 350640 in my Falcon and it works fine under TOS 4.0 and under MagiC, using 8 partitions (50 MB for the boot partition, 886 MB for the others). This is a 3.5" device used with an adaptor for connections, which will just fit on top of the shielding.

So your VME card supports additional memory? I'd heard something about this, but hadn't heard of anything successful. There was also something I heard about a VME thru-port allowing more than one card, but I'm very vague about this. Was there something about only a certain amount of memory being addressable by this method?

I'm out of my depth here...

Source record: 27768

Bonjour :)

Yet another snapshot software: fVDI Catcher.
Tis a freeware written to make screen snapshots
with Eclipse/RageIIc. Runs as accessory, under
GEM. Saves GIF or uncompressed TGA.

Works in all ST and Falcon standards screen modes.
Works in TC16 Eclipse/RageIIc screen mode.
Still problem in TC32 (RAGE.SYS driver byte-swapping
not corrected in this mode) and 256 colors screen mode
(need contact with fVDI author).

I don't think it's working with others graphic cards,
especilly in TC modes.
Mail me you you want to use fVDI Catcher with your
graphic card.

Download at http://rajah.atari.org or directly at
http://rajah.atari.org/files/ -> fvdisnap.zip (<20Kb)

The GFA sources are provided in the updated fvdicsrc.zip.

Voila :)

2389. A survey poll for you...

Newsgroup: comp.sys.atari.st
Date: 2003-05-05 02:17:17 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <3eb5c9de$1_1@corp.newsgroups.com>
Source record: 27771

Please go to:
http://www.angelfire.com/az3/luposian/

I only ask that it be answered honestly, to the best of your ability. Please ask all the current and ex-Atari users you can to come and answer it. Leave your First name/Email address (or just a comment; explaining why you chose the selection you did) in the comment section, so that I can use it as reference in my report, should enough people respond to even warrant bringing it before Infogrames' attention.

What is "enough people", you ask?

A number equaling anywhere from 50%-100% of the numbers that Amiga, Inc. had when requesting $50 for their "Free T-Shirt/coupon" offer. And this is FREE! No money required. No hype. No future promises. Just a request to answer a simple poll. That's it!

This poll is just to get an initial impression of how many Atari users are actually out there who want something more, if anything at all, out of "Atari" in it's current state.

If you have some horrible "irk" against me and any of my ideas concerning Atari, please don't go. This poll is not designed to give you a place to flame me. The only part of "me" involved in the process is placement of the poll itself. You're the one that answers. Your vote is the one that counts. Do you want anything more from Atari itself or not? It's that simple.

Luposian

> that piece of hardware?

For this drive correct termination is very important. And some drives require initiator identification, which is only available with a LINN96/97. Note, by the way, that you cannot switch off parity checking if you only have a hos adatper that does not provide parity. In order to switch parity checking off you have to connect your drive to an Atari (or another computer) that recognizes the drive. If you only have an Atari that does not reccognize your drive you cannot access it at all, and in particular not to change the parity settings.

> viable?

What I don't understand is why you want to pay for hardware that is not state-of-the-art, in particular because it does not support initiator identification. More and more current drives do not work with the LINK2 but only with the LINk96/97 because of that.

>>
>sorry but you can networking with macstip/iconnect and use ethernet port on
>the mac on a network, you have to conf your network under macos
>macstip bypass the dialup and use the macos network conf

So what you're saying is that all you have to do is to set the STIP box in
IConf and IConnect will automatically use the Mac's Ethernet port if its
been set in TCP/IP etc?

>ps: macstip don't work on macos >9.* , 8.6 max for use it

I know at least one person who is using IConnect via stip under OS9.2.2
using dialup, so maybe it's only Ethernet access that's broken OS8.6> ?

Thanks for this. I had searched in Google newsgroups for info, but found
little or nothing.

If this stip isn't part of the Mac OS I haven't been able to find any
mention of it on ASH's web site BTW.

Cheers

An even better approach is to let them filter out themselves. Usually
those who can't standup for there thoughts tries to hide there acts by
using the header line "X-No-Archive: yes" to avoid being archived by
search engines.

Simply add this line to your kill filter and they will not bother you
again!

A typical Newswatch kill filter might look like this:

Newsgroups: *swnet.diverse*
Newsgroups: *alt.nuke.thomas-nord*
From: *sinclap*
X-No-Archive: yes

My guess is that it's a password authentication problem. Log in using a
terminal program and double-check what it's expecting against the pap-
secrets file or whatever.

Thanks for your results :

Some remarks :
1- There is a strange thing about the Milan 060 at 50 and at 60 MHz : 2 minutes of difference for only 1/6 increased speed ???
There is something wrong here !
2- I thing the HADES 60 has a EDO updated controller, correct ?? (the first Hades had a FPM controller and a hard patch kit was available for hades user !).
3- Let's do some CT60 tests at 72 MHz ;-)

Strangely enough the only really useful stuff on the 'language' disks are
the hard disk drivers. Search the net for AHDI and that will give you a hard
disk driver that will be pretty much all you need for a start.

Thanks for your reply! I did do this, making a text-file copy of the output to have a semi-permanent source to refer back to. However, my script and pap-secrets files are just fine, according to this. In fact, MagxNet does indeed receive and display a correct IP address, which it could not have received unless it made it past the initial login phase. The other pertinent files are taken from the settings in the TCP/IP and Internet control panels on my Mac, which connects fine.

Also, the only TCP/IP stack I can get to work on my Falcon and this ISP is STiK2. STiNG, Draconis, and now MagxNet refuse to hold a connection. I don't know what the difference is that's making STiK2 operate. All pertinent settings are identical, I've tried it with everything from a clean system to a fully-loaded system, etc. I've tripple-checked my HSModem settings, comparing them to example settings people have sent me at various times. I'm at a loss. I'm currently shopping around for a new ISP, but I don't have the time to really put into it and get a new one quickly. And who knows if that would fix the problem. So I'm hoping I could get it working with the one I'm using now. It would be even better if I could get *all* of the TCP/IP stacks working.

Thanks again!

Hello!

I designed a web site for our church group, using my Falcon, and our church's network guy asked me to put it in a zip file and e-mail it to him to upload onto the church's web site. However, when I tried to use ST Zip to do it, it couldn't read the long filenames, and consequently, the zipped files used 8+3 format. This kind of destroys my links, and I would have to go through and either explain how to rename the files (and hope he gets it all correct) or switch all my links to 8+3 (which I really don't want to do). Is there a way to get ST Zip (version 2.6) to accept long filenames, or is there a newer version I should be using? Or is that yet another area where we are still stuck in the dark ages? Your help would be appreciated! Thanks!

Me too. However, that's due more to history than anything else. I started with a Link on an STE. When I got my Falcon, upgrading to ICD Pro meant that nothing had to be learned, HD-wise. If I were purchasing software new, I'd buy HDriver. In fact, I'm probably going to buy a copy soon, for it has significantly more features than ICD Pro.

STZip has several weaknesses, the inability to deal with long
filenames among them. (That said, I still use it.) You might try
Info-Zip 2.3 (http://www.info-zip.org/pub/infozip/Zip.html), perhaps
with a shell. If it works well, kindly email back to this discussion,
since I've never tried it.

If you're using MiNT, or Magic and have added a MiNT cookie to the
cookie jar, STZIP will handle long filenames. Otherwise it will only
produce archives with the names in 8+3 format.

All I have is what came with the ICD host, and the only thing it doesn't do with the TT is set up a catche as there is no host card that I used to have. It's to bad the ICD couldn't offer a REPAIR of their host cards, I'd send in mine real fast. It died when a leak formed above it in the trailers roof and a drop of two of water hit while powered up.
Otherwise I'd have my other old ibm drive (500megs) hooked in the atari hard drive port on the back.

Uwe,

Are you aware that the Link 97 is not in production any more? At least Best Electronics can't seem to get them. In fact, he's having a hard time with WB Systemtechnik responding to his emails.

I think the Atari ST/STe community is in desparate times right now because of the lack of a modern SCSI host adapter. As you said, newer SCSI HDs don't support the Link 2, but there is no choice. Link 97s are impossible to get, so the community is stuck with whatever older ICD, Supra and Atari host adapters are out there. Since there are no new SCSI host adapters for sale anymore (w/o paying over US$100 for an ever shrinking supply), people are looking at every option out there. If the Link97 could still be bought, I don't think this proposal would have surfaced.

Can anyone in Germany talk them into doing another run? Or license it?

Please, if someone out there is working on a Link97 or other host adapter replacement, please speak up. I hope we never have to work with the devil (Tom "The Crook" Harker) out of desparation for a SCSI host adapter.

Thank you.

>What I don't understand is why you want to pay for hardware that is not
>state-of-the-art, in particular because it does not support initiator
>identification. More and more current drives do not work with the LINK2
>but only with the LINk96/97 because of that.

Editorial on
I've always had a feeling that the Atari ST community would be in really bad shape if two hardware upgrades were not available:
1) 4MB memory upgrade
2) SCSI host adapter
We can live without accelerators, digitizers, graphics cards, etc, but without 4MB and a hard drive, you really can't do any...power computing (for lack of a better word). Try multitasking with Geneva, Magic, Mint, Jinnee, etc without these two hardware features and you'll be in for a lot of annoying disk swapping, lost time,etc.
Editorial off

I use Magic. How do I add a MiNT cookie to Magic's cookie jar?

Hehehe,

And I have at least 4 scsi host adapters not doing anything off the top of my head. Guess I should start selling them off.

I didn't know that for sure. Anyway, it would IMHO make more sense to try getting the rights for the LINK97 hardware than for the ICD hardware. I'm not so sure as others in this group, however, that there are many users left that want to buy a host adapter. If there were, WB Systemtechnik would most likely still produce it.
Let's face it: If the number of users still purchasing HDDRIVER or updates gives any indication on how many users are still willing to spend money for harddisk-related hardware and software I am sure that WB won't produce any more adapters. This year about 20 users have purchased HDDRIVER, maybe another 20 purchased an update. These numbers IMHO indicate that any investment in the Atari scene, in particular wrt hardware, does not pay off for those who have to earn their living with it, like WB.

> Can anyone in Germany talk them into doing another run? Or license it?

I will ask them about the current status.

I ended up writing a small program that added an extended cookie jar and
added the fake MiNT cookie at the end. There's a copy of it, and the
assembler source, at:

<URL:http://www.my-ste.demon.co.uk/files/fakemint.zip>

There's no docs with it since it was a quick-and-dirty "give me long
filenames" hack. IIRC it works with STZIP and LZHSHELL.

You can add this cookie by using FakeMint.prg utility that I have just sent you ;-)

But if you just want to make ZIP archives with long filenames, you don't need to have anything to do with MiNT ;-) It's enough to use Jinnee's zip plugin. Select the group of files, click with a right mouse button, choose Plugins -> Create ZIP archive and you will get a ZIPped file with long file names. At least this is the way it works for me.

Have you tested your controller seperately from the computer? If not
you should do this first this way you will at least know if its the
computer or the controller that is the problem.
I suspect its your controller as buttons A, B, C and Option are all
routed to the same output pin button C should also work indicating
that part of your problem is that you either have a connection problem
to the entire C strobe line or to the C button itself.

Visit Philipp Donzï¿½' web site at http://home.tiscalinet.ch/donze/ and
download his ZIP TTPs, which handle long file names. Grab Arcview at the same
time if you want a nice GEM interface to go along with it.

Arcview has long since supplanted STZip on my system.

Cheers

Nothing interesting is on these disks.

Best bet, go for HDDriver from Uwe Seimet. It will handle those larger IDE
drives just nicely. If you want to use both drives at the same time, you
will have to set the ID jumper on them and get a 2.5" cable with 2 drive
connectors on it, and make sure it isnt longer than necessary or you will
have problems.

Source record: 27706

Ok, so here's what I've come up with.

The general opinion of Mr. Harker is slightly less than desirable (:>)) .
It would appear that there is a very small market for demand, thus, ICD not
producing any more of the items. I have contacted numerous friends who
have access to or work for companies that produce schematic boards and have
found that startup costs are tremendous compared to the small amount that
would be sold. One would have to be very dedicated to the Atari line or a
fool for investing large amounts of capital to start up something that would
not have a considerable amount of return on investment.

I, being very much into Atari, although not a fool with my money, have
decided that this is now a dead issue. It's really too bad. I would like
to see at least some solution to hardware expandability on these machines.

Thanks again for everyone's input, it has been an enlightening experience!

From: ekaljuma@mtsac.edu (Galen)
Date: 27 Apr 2003 19:02:49 -0700

Hi Galen,

>Please note that "work" is defined as 300dpi black and 300dpi CMYK (on
>color capable printers). Resolutions above 600/720dpi and newer
>features (like 5 & 6 color printing) are unlikely to work.

In other words: the printers that are for sale at the moment aren't really
worth bying at all, a 300dpi maximum resolution warps us back in time some
15 years.... :-(
Say goodbye to "photo quality" prints on a Atari :-(

>Currently available printers that are fairly likely to work with the
>Atari...
>
>HP Deskjets 3820, 6122, 6177
>HP Laserjet 1300
>Epson Stylus C62, C82
>Epson Stylus Photo 8xx and 9xx series
>Brother Laser 5050 (Epson FX emulation!?!)

I haven't followed this thread from the start but the Epson C62 and C82,
just like their predecessors the C60, C70 and C80 definitely do not belong
in the above list. The "C" printer line are so called GDI printers and thus
not suitable for Atari computers... the best you'll get from these printers
is ASCII output in "proof" quality.

The new Epson Photo 915 and 925 models wont work either, but the Photo 950
printer will (up to 1440*720dpi).
BTW: the Stylus Photo 8xx line is discontinued...

The only Epson printers (and most likely the only brand) available at the
moment that allow "normal" printing under NVDI are the:

Epson Stylus Photo 950 (to be discontinued very soon)
Epson Stylus Photo 1290
Epson Stylus Photo 2100
Epson Stylus Color 3000

I define "normal printing" as being capable of addressing the full range of
resolutions supported by NVDI, which in this particular case is 1440*720 in
both monochrome *and* colour resolutions. Unfortunately the above mentioned
printers all cost a small fortune....

>Brother 1440 laser -- $230US (I said 1240 before, which works, but is
>discontinued)

Some more laser printers that allow "normal printing" are the:

Epson 6100 (do *not* confuse with the 6100 L model!!)
Kyocera 1800+
Kyocera 3800
OKI B4200
Samsung SCX-5312F
Lexmark T420d

It's crystal clear that the list of "compatible" printers just like the list of compatible scanners, cd-writers, cd-roms etc... is getting smaller every year. The way things are going in a year or two we wont have to discuss this topic anymore since there wont be anything available that actually works. We *urgently* need a set of new printerdrivers for NVDI, not to mention drivers for readily available USB interface/convertors. We need to find a talented Atari programmer who's probably hiding under a rock somewhere, and get him working at it.... whatever the cost.

Cheers from Belgium
Dennis

I used HDDriver and can confirm that it worked fine. It even supported
bus arbitration (two active devices accessing the same hard disk) and it
worked fine. I had the Falcon at one end of the SCSI chain and an Akai
sampler at the other end and both were accessing the same hard disk
and CD-ROM (not at the same time though) in between these two.

I've already tested the controller on its own. It seems to be connected
perfectly (at least, according to the two separate circuit diagrams I found)

You know, an Atari STe with 4 meg, VGA/Composite video outputs, MIDI ports, PC keyboard, PC mouse, and PC ports, 3.5" 1.44M floppy and an internal IDE hard drive put together into as small a package as possible would be one of the coolest things in the world for musicians such as myself.

Hi Uwe,

I totally agree with you that the Link97 host adapter should be THE host adapter to obtain the rights to or to restart production. (I was just explaining why I think Jon was after the ICD stuff instead)

Regarding sales of HD Driver...I think 20 copies is pretty good for such a tiny market. Congratulations! :-) But I think there are people who are hesitant (cheap?) to buy anything Atari. So they settle for AHDI or CBHD instead. They may not need the power of HD Driver (though I HIGHLY recommend your excellent program myself). So these people still need a host adapter.

Just my opinion. I think WB Systemtechnik should make a run of at least 50 should suffice for a while. Suppose 20 adapters were sold to your HD Driver customers. Then I would predict maybe another 10-15 adapters sold to AHDI/CBHD customers. That leaves 15-20 adapters not _immediately_ sold. Is that too much inventory lying around? I don't think so. I think there will be demand as Ataris become more popular in this decade.

Anyway, that's my take on it.

- Phil

I just verified this figure and found that I had misjudged the number of
copies sold: Actually it's less then 10.

> program myself). So these people still need a host adapter.

A host adapter is much more expensive than driver software and somebody
who has to earn his living from selling hardware less than 10 pieces in
several months does not pay off. But is has to if you depend on the money.
And don't forget that if you sell something you have to provide support.
This costs time which you cannot spend on other projects with a higher
commercial potential.

Unfortunately the ICD Link II isn't the right hardware to be investing any
mony into, unless you can get it redesigned to better cope with more modern
drives.

Cheers

I have try in the past to find more info on "maus.computer.* " newsgroups
and also on the "old" magiconline site :
.....................................
"
Although the built in modem is fast, one of the incredibly
cool advantages of having MagiC on an iMac is its built in
10/100T base Ethernet port! This makes fast cable modems
easy and simple to hook up. You need STip to use your cable
modem under MagiCMac!
Imagine using CAB with transfer speeds of over 15 times
faster then your 28.8 modem offers! If you are one of the
many people who are fed up in trying to setup I-Connect, STiK
or StiNG, do not worry. There is a special feature in I-connect
which allows you to use your Mac TCP/IP stack "STIP."
What this means is that you are able to setup your Internet
account under Mac OS, and connect to the Internet with it
under MagiC Mac. You will only be able to run I-Connect clients,
but this feature is the beginning of truly integrating the best
features of Mac OS and MagiC.
"

Yep, spotted it this time and put the patch somewhere safe. I'm a little behind with wine presently (I have to keep borland linker working).

I downloaded the Lite version & can confirm it does crash as you state. FreeBSD4.7 here. I also tried the ST version and it did pretty much the same under MPC. Uh oh - must do something about Aranym as well. Soo much, little time!

I disagree. We never really HAD photo quality on the Atari. 1440x720
CMYK is the best ever available via NVDI. On the other hand, 720dpi
color provides decent output, and 300dpi black is fine for text (which
is 95% of my printing). My definition of "work" is based on printer
driver development. For a while, deskjet and laser development went
hand in hand, so I suspect (but do not have proof) that PCL6 is a
superset of PCL3, though it is not a superset of PCL3e or PCL5.
Similarly, ESC/P(Raster) is hopefully a superset of ESC/P, though it
is not a superset of ESC/P2. Thus I'm hoping that at least SOME
printing capability can be obtained.

Noted. Thank you! (Have you personally tried this?)

> The new Epson Photo 915 and 925 models wont work either, but the Photo 950
> printer will (up to 1440*720dpi).
> BTW: the Stylus Photo 8xx line is discontinued...
The US market appears to use a different numbering system. At the
moment, several 8xx and 9xx models are available. Do you have a Photo
950 in use? If so, that would be good news! The 915 and 925 won't

work, of course, for they are USB only.

I fear you are correct. Unfortunately, someone noticed that they
could SELL technical data instead of give it away, and now it is
difficult to even find out what to do, let alone how to do it. I
still do everything except web-browsing on my Falcon right now, but
that will someday have to change.

Time, you just connect the other computer at the end of the chain, instead of terminating the last device.

You know, a series of SCSI devices on the bus is a *chain*. You have one computer connected to A, which connects with B etc. and the last one should be terminated (have a small blob connected which marks the end of the chain). But instead of terminating, you just connect yet another computer (or sampler as in my case). It works as a terminator, but it is also an active device, which might take control of the bus.

In my case I had a configuration like this:

Falcon --- Hard disk --- CD-ROM --- Akai sampler

The Akai is basically a computer so one could have a computer there instead. I had (well have) sampling CDs for the Akai, which I could access on the Akai and I could also use the same CD-ROM drive for the Falcon. For a while I used a SyQuest drive with removable 220 MB cartridges instead of the above hard disk. Then I sometimes stored samples in Akai format on a couple cartridges and had another cartridge, which was Atari formatted, and stored programs on it. Quite neat.

However, don't let the two computers access the bus exactly at the same time. But they can indeed be switched on at the same time though. The documentation to HDDriver confirms that bus arbitration is supported. However, I think there were some limitations, for example that you should avoid accessing the bus at the same time etc. but I'm not sure, so look it up in the manual. The above configuration worked for me.

```
Free Unknown Condition Atari ST Stuff:
======================================

1 Navarone Atari ST cartridge port->SCSI(?) scanner adaptor
1 dead Atari 520 STfm (parts?)

Free Working Atari ST STuff (used a few months ago):
====================================================

1 Atari SM125 mono monitor
1 Atari SC1435? colour monitor (Goldstar?) - starts to flicker when it gets hot
1 Atari Mega ST 2, upgraded to 4 megs - no power supply, but has hacked
connector to connect to PC power supply (I have a PC case + power supply for
free too - grab that, and you're good to go!)
1 Atari SF-314 case + circuit board to plug into regular 1.44 floppy + power
supply + floppy connector cable (actual drive is in a 1040stfm)

1 Atari STe-1 motherboard. Includes 4x256k ram Simms, no floppy controller
chip. Has standard PC power supply connector, booted off hd when I tested it
several years ago.

Free Atari ST books/software
============================

Metacomco Pascal
Laser C (w/ source code debugger, etc)
GFA Basic 3.0, GFA Vector, etc
DevPac ST (later version)
various other original titles (Flash, Shadow the background transfer
program, QuickST, Sudden View, some games, etc)

GEM Programmer's Reference
ST Internals

Everything is free if you pick it up in Kitchener-Waterloo. Otherwise,
whatever it costs to ship.

From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3eb986b0$0$24921$626a54ce@news.free.fr>
Source record: 27739

I'm very proud to announce you that I just find the last known bug on CT60 !
The Blitter and the SDMA now run fine with the CT60.
The arbitration is correct.
I have some things to tests and maybe increase like the ST-ram write timing
(just an idea to improve the Videl video accesses !).

Here is the planning for the next days :
- test for 66 MHz with the F08 buffer on the GAL U63 (many Falcon are like
this to correct the 'SDMA clock bug')
- test for 72 MHz with and without F08.
- test for Falcon boost at 20 MHz (instead of 16).
- complete and verify the fitting documentation.
- shipping of the CT60 for the developpers.
- 15 days delays for developpers tests !
- shipping for everybody !

I have an ADAP 1 hardware sampler, and I have been trying to get it to work with my Falcon. I know it was originally intended for the ST line, but the software works on the Falcon up to a point. Oddly it will sample a sound beautifully, but it won't play back via Midi. Does anyone here use this stuff, and if so do you know the latest version of the software?
Thanks, Mark

>I was considering the purchase of an LCD monitor for my Falcon. Does anyone
>have any "do's or don'ts" they can share on this subject? Any help is
>greatly ap-
>preciated.

I use a 15' 1024*768 Samsung LCD with my TT and a ET4000 card. Works
great and is really superiour to a CRT.

But this is only true at just 1024*768, any other resloutions are
terrible. This monitor is also more sensible to errors in the signal
compared to my CRT. It needs more precise values to sync.

I also have it running at 800*600 and 640*480 and the important 640*400
for booting. All these at 60 Hz.

So, note that LCD monitors only works really well in the optimal
resolution. On the other hand you get a perfect flicker-free screen at 60
Hz which a Falcon might benefit from.

Make sure that you can match scan rates and resolution to that which the LCD
will accept. I couldn't get anything but 640*480 to work with the one that I
tried, bought for another computer system.

Cheers

Hi.

Is anyone using here the excellent MIDI-sequencer Live?

I really love the handling of the program, but unfortunately suffer
some problems with my version 1.62. I heard there are newer versions
(even 2.0?), but even the old company in Germany doesnï¿½t have it
anymore ï¿½ so I am also looking for updates.

Anyway, Iï¿½d like to discuss with some users of Live. Just drop me a
line...

Hi, "D."!

DG> I dont know if i have explained myself correctly. :-)

Well, hardware is not that hard as it was in former days. Nowadays you are coding your hardware as well (in VHDL or in Verilog as "higher level languages" or in lower levels in form of GAL or PAL equations). You compile your code for a certain target architecture (typically FPGAs by two well known companies) and then you program those logic-ICs.

By this you can have the hardware finished and still remove bugs from the "hardware-logic" burnt into those logic-ICs.

This way of improvements have been done for PAK/FRAK and Panther GALs as well as for the HADES logic-ICs (former versions did only support FPM-RAM, later versions EDO-RAM f.ex.).

Regards,

Alexander

My Falcon030/CT2b is connected to a 15" iiyama AX3817UT DBK monitor.
I can use all standard Falcon 640*480 and ST 640*400 modes. But the only
extended resolution that my CT2b+Centscreen offers and that works on this
monitor is 640*480*TC. 800*600 or 1024*768 are refused :-(

Only for 640*480*TC I have to change the "clock" setting on my monitor
from a value of 50 (factory setting) to 43 to get a perfect image.

dil also, they did, however, have a megabus expansion. This socket was
designed for cpu expansions such as vga cards. Which is most likely where
this unit plugs in. You will need a megabus adaptor, in theory it wouldnt be
too hard to make. Just had a look, the white strip along the right hand side
is the megabus socket.

I'm glad to see this thread. I was going to ask if an adaptor exists which
would allow the Atari to be hooked up to a VGA monitor but I guess that
question is answered--that is unless the Falcon has some output which my little
1040ST does not.
So what do I get and where do I buy it to adapt my Atari to VGA?
Thanks,
Garth

Has anyone the chance to test Apex Media on the CT 060 as of yet?
Compatibility with Rainbow Multimedia II, NeoN, Phoenix (Xenomorph),
Chronos (key frame animator)and even ImageCopy is of interest on this
end.
AFAIRC, we don't have a "pass through" on the CT060, wondering if any
developers have tried installing something like a ScreenEye or Expose
video capture card beneith the CT060 using adapters.
TIA,
Mike

Actually I was thinking of purchasing only hte cpu card which replaces
the DIL processor. You actually need to unsolder, but since mine is
upgraded with AdSpeed already, I figure why not.

Thanks,
Mark

>since I've never tried it.

A serious weakness is the inability to have more than a limited number of
files in the root directory of the archive (don't remember the exact
number but it is something between 100 and 200- not a large number at all!)
If there are more files in in the root directory, STZip creates (without
warning) a corrupted archive.

Infozip's zip/unzip package works well, and have some very useful functions,
such as the option to repair (as much as possible) a corrupted .zip archive.
However, it has some bugs too- at least the single-TOS version of unzip
has problems in putting the listing of archive contents on the screen
I suspect an incorrect line ending (not <CR><LF>) was coded.

Btw. there is a port of infozip pack which works in single-TOS and there is
also another port (of the same version) which *requires* mint.

yes...it is here:

http://tamw.atari-users.net/liveplus.htm

This was a special version that Harold made for us in that it is a
demo version, but you can save as standard MIDI files. I find it very
much like Cubase and the graphics are excellent.

Also...the Atari-MIDI forum is excellent and we now have over 400+
members!!
Info on my site.

Well, sometimes drivers change. For example, the older Lexmark
printers used to use PCL3 for a print language, but the new ones
don't. For what it's worth, both printers mentioned above are over
the $400 limit I artificially assigned myself, so they won't appear on
my list. The Kyocera FS1010 Laser however is under $400 and has
PCL5e, IBM Proprinter, and Epson (FX?) emulation, so it will go on my
list of "likely to work" printers.

I'm not sure I agree with the superior part. I still think a $400 CRT
will beat a $400 LCD.

That said, LCD monitors are a tad more finicky about syncing (IMHO),
so I'd be reluctant to buy one unless the place had a real good return
policy!

> So what do I get and where do I buy it to adapt my Atari to VGA?

Actually, the Falcon does in fact have output the ST does not.
However, ST High is NEARLY the same as monochrome VGA, so you can get
a simple adapter cable and any VGA monitor that can handle multiple
resolutions (pretty much any one I've seen made after 1998) will be
able to display it. You won't get STLow or STMed though.

STHigh : 35.7 KHz, 72 Hz refresh, 1.0V max
VGA: 31.5 KHz, 60 Hz refresh, 0.7V max

If you don't want to buy, it shouldn't be too hard to make. Here's
what I found on the web (note, I haven't tried this myself):

ST to VGA (ST High)

ST pin number VGA pin number

9 (H Sync) --------- 13 (H Sync)
12 (V Sync) --------- 14 (V Sync)
13 (GND) ------------ 10 (GND)

10 (Mono Out) needs connecting to 4K7 resistor, and then to
VGA
pins 1, 2 and 3.

The following pins also need connecting together on the VGA connector:

4 (Monitor ID Bit 2 ?)
6 (Red GND)
7 (Green GND)
8 (Blue GND)
10 (GND)
11 (GND)

The following pins also need connecting together on the ST connector:

4 (Mono Detect)
13 (GND)

Source record: 27575

Need money, will sell these to the first person that comes up with a
defent offer.

- Afterburner040. 68040 accelerator for the Falcon. 32Mhz, upto 64Mb
fastRAM. Right now thereï¿½s 48Mb installed IIRC (but it might be
32Mb). 5 to 8 times faster than a standard Falcon. Has a though-port
for the Falcon expansion bus, so graphics cards and digitizers can
still be used.

- Eclipse graphics card, complete with 4Mb ATI graphics card. Very
fast, works very well with the Afterburner.

Must sell these to finance speeding tickets and some new parts for my
motorcycle.

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

Hi Folks.

I rang the technical department of Epson UK. I explained that
I was using a Falcon and an Epson Stylus 600,and that I wanted to know
if the Epson C82 would work with my computer.

Ok, the guy was rather bemused that I was using some strange computer
that was not a PC, but after I explained what a Falcon was,and the
fact that it did not use MS Windows,or USB, he very kindly referred to
his list of printer specifications.

He advised me that the Epson C82 would NOT work.The only two printers that
he could suggest with spec similar to the Epson Stylus 600 that were likely
to work were the C980 and the C880.

Of course 'likely to work' is no guarantee that they will indeed work
when connected to our systems .

Unless anyone knows better through hands-on experience !

Regards,

Paul.

If it's a "Econosis" printer it can save you money, as the toner and drum
can be changed separately.

Cheers

>>
>I'm not sure I agree with the superior part. I still think a $400 CRT
>will beat a $400 LCD.

The overriding advantage (with a Falcon at least) is that an LCD monitor
is reputed to flicker much less than a CRT.

I have in fact witnessed a Falcon driving a Dell TFT monitor, and the
results were very good indeed. I don't remember what res. was used, higher
than 640*480 at any rate.

Cheers

Apex Media runs on CT2 and Afterburner040 so it _should_ run on the CT60.
Rainbow doesnt like accelerated falcons at all and only runs on 16MHz so
I think we can forget about that one.
Neon runs (just about) on my 040 but is a bit unstable. Phoenix runs with
no problem on 040 and so does Imagecopy.

It slots into the Falcon expansion bus, with 8 (IIRC, I installed it in
1997...) wires to solder. And you have to lift two pins on the 030. Easy
if you're a bit experienced with a soldering iron.

When it will be time I will install a page on my web site to concentrate the software tests YOU will do on CT60.

For the time, what is the problem with rainbow...?
Because don't forget that a CT60 don't boost the falcon motherboard (in the minimal fitted configuration) so problems will be very rare.

Rodolphe

Hi Paul,

>He advised me that the Epson C82 would NOT work.The only two printers that
>he could suggest with spec similar to the Epson Stylus 600 that were
>likely to work were the C980 and the C880.

He's correct...
All the Stylus Color Printers from the 800 and 900 model line will work on
Atari. Note however that the C880 and C980 only are capable to print up to
1440*720 dpi under NVDI, the older models C850, C950 and C960 allow to
print up to 2880*1440 dpi, I'm not sure about the C860...
Another matter to consider are the inkt reservoirs: the tanks of the C950
and C960 are massive and can easily be refilled by the user. The tanks of
the C880 and C980 however are much smaller and the printers keep track of
the inkt volume.... these two models should be avoided !!
IMO the best of the bunch are the C850 and C950, build to withstand a war,
very fast and cheap to run :-)

Cheers from Belgium
Dennis

>I disagree. We never really HAD photo quality on the Atari. 1440x720
>CMYK is the best ever available via NVDI. On the other hand, 720dpi
>color provides decent output, and 300dpi black is fine for text (which
>is 95% of my printing).

This isn't just a matter of agreeing or disagreeing, personally I wouldn't want *any* of the printers on your list. A 720dpi colour output may be OK and acceptable for you, but it isn't for me, when printing at 1440*720 on an Epson 950 under NVDI in CMYK the resolution is doubled (interweaved) so in practice one ends up with printed output at 2880*1440. I don't use that resolution very often (printing takes forever), but at least I know the option is there if and when I need it. The point is that with the printers on your list one doesn't have the choice, they only deliver up to 720dpi. If all one needs from a printer are a couple of pages from a wordprocessor and the odd colour print from a snapshot, then the printers on your list will do.
"Photo quality" is just a slogan, IMO it stands for a print of which we perceive the quality to be equal or nearly just as good as a photo. Ask any

serious photographer or amateur what he thinks of today printers so called

"photo quality" and you'll get a very amusing reply....
Anyway with the right kind of expensive paper and original inkt one will get a very decent looking print from most printers at 1420*720dpi, at 720*720dpi however the quality suffers to much, but then again that's my personal opinion :-)

>>I haven't followed this thread from the start but the Epson C62 and C82,
>>just like their predecessors the C60, C70 and C80 definitely do not
>>belong in the above list. The "C" printer line are so called GDI
>>printers and thus not suitable for Atari computers... the best you'll
>>get from these printers is ASCII output in "proof" quality.
>
>Noted. Thank you! (Have you personally tried this?)

Yes...
At the office where I work there are plenty Epson models to play with, the Epson "C" printers line don't work at all. The previous models 850, 860, 880, 950, 960 and 980 were just perfect. I think these six printers are undoubtedly the most NVDI compatible printers ever made... with a little luck you can pick up a refurbished model from somewhere. The 850 and the 950 are build like tanks and probably will last forever... these 2 models are probably the best printers Epson ever made.

>The US market appears to use a different numbering system. At the
>moment, several 8xx and 9xx models are available. Do you have a Photo
>950 in use? If so, that would be good news! The 915 and 925 won't
>work, of course, for they are USB only.

Over here some 8xx models are still for sale in most shops as well, but Epson has officially discontinued them. I can't elaborate on those models anyway because I never tried them out....
I'm pretty sure that I tried out the Photo 950, but hang on until monday morning, the first thing I'll do when I arrive at the bank is to test it out ;-)

>>The only Epson printers (and most likely the only brand) available at the

>>moment that allow "normal" printing under NVDI are the:

>All but the first are too expensive for my list.

I presume you're not about to make a new list every six months? I'm pretty sure that in a year from now, none of the printers listed will be for sale anymore, meaning you or anyone else interested in these particular models will be able to pick them up for a nice price from a reseller.

> Some more laser printers that allow "normal printing" are the:
>>
>> Epson 6100 (do *not* confuse with the 6100 L model!!)

>> Samsung SCX-5312F
>> Lexmark T420d
>
>Noted. Again, do you have personal experience with these?

Yes, and there were more, but since I don't recall the model numbers correctly anymore I left them out of the list. I do remember however that none of the Canon laser printers worked, so stay away from these....

>>It's crystal clear that the list of "compatible" printers just like the
>>list of compatible scanners, cd-writers, cd-roms etc... is getting

>>smaller every year. The way things are going in a year or two we wont
>>have to discuss this topic anymore since there wont be anything available

>that actually works.
>
>I fear you are correct. Unfortunately, someone noticed that they
>could SELL technical data instead of give it away, and now it is
>difficult to even find out what to do, let alone how to do it.

That's the fairy tale they told us.... but AFAIK people using Linux don't
have that problem, and since Linux stuff is open source, it should be a
piece of cake for a talented programmer. The real problem IMO is that NVDI
isn't supported anymore and there's no alternative.

>I still do everything except web-browsing on my Falcon right now, but
>that will someday have to change.

We've seen this coming.... I have a compatible printer, scanner, cd-r and
cd writer here. Whatever the industry has up it's sleeve, they can't hurt
me... I've written this time and time again: upgrade now, because tomorrow
it might be to late. It's already to late for someone who wants a scanner,
but there's still some time left for the other stuff.
Anyone who has a computer with graphic card as is contemplating buying a
larger monitor should act now also.... it's quite obvious that monitors are

the next thing on the way out...

Cheers from Belgium
Dennis

I have used PayPal using CAB. But I think you'll need MiNTnet and the CAB.OVL for MiNTnet that supports SSL. On the Atari Platform SSL is only supported with MiNTnet (and possibly MagicNet, maybe a MagiC user can confirm this? I don't know a thing about Magic).

Sorry for the double post. I wasn't thinking. Based on what I can tell,
teh SSL ovl will need work to work under MagiCNet.

Thanks,
Mark
http://atari-source.com

PS: Ben, in order to use mintnet, cab-ssl.ovl and use the paypal website
effectively, I would recommend a TT or Falcon with 16 megs of ram and
easymint. An ST would probably do fine too, as long as it had more RAM.
MiNT is memory hungry, and rightfully so... it does more.

Um - 4k7? You won't get much brightness then, since the monitor end of the
cable is terminated with 75Ohms. You might use a 75 Ohm resistor in series
of each of the R, G, B signals connected to MONO OUT - or just leave them
out.

>The following pins also need connecting together on the VGA connector:
>
>4 (Monitor ID Bit 2 ?)

These are inputs on the PC VGA connector (and outputs on the monitor), so
there should be no need to connect them on the monitor.

An alternate solution that work on all systems is to get a "boot floppy"
with a hd driver on it (ex: AHDI.PRG). Put the floppy in the drive, and boot
while pressing the ALTERNATE key. It will force the st to forget about hard
drive, and you will get access to the gem desktop, run the driver from the
floppy, add an icon for C: (top right menu "add icons"), and modify what you
want on the hard drive.

Hope it helps.

Strange... The ALTERNATE key made no difference, but I was able to hit CTRL-C during the boot process after the HD drivers loaded but before MiNT loaded, and get into the desktop.

Is the ALT key thing something that was added after TOS 1.0?

Thanks.

-Jason

2523. Thing, Devpac and PATH

Newsgroup: comp.sys.atari.st
Date: 2003-05-10 15:37:53 UTC
From: fredrik_egeberg@hotmail.com
Message-ID: <9afb451c.0305100737.24bc94d1@posting.google.com>
Source record: 27655

Whenever I start devpac (3.11) from Thing (1.29) in singleTOS I always lose the PATH setting in devpac's environment window, this is normally saved and loaded when devpac starts but for some magical reason it wont set the PATH to what it was. I can load the settings once started and the PATH will be whatever I set it to be but it wont do it on startup.

Any ideas whats going on?

Fredrik.

I usually just boot from a floppy and get to the desktop. Then I
run the hard drive driver program from the floppy, install drive
'C" the boot partition and then adjust the auto folder from there.

I do not think so at the moment. I believe it requires javascript.
You may want to try using Draconis, MintNet or else wait for
Highwire to get javascript enabled.

I had great problems when using STZip. I would try out Arcview. It
works well with long file names.

AFAIK it depends on the hard disk driver, not on the TOS version. I use HUSHI on my 520ST with TOS 1.0 (1985) and when I hold Alt key it boots from the floppy. This method also works with HDDriver. Don't know about AHDI, though.

When you press (and hold it, for quite a long time...) the ALT key during bootup, the hard disk driver should not load at all, so you would not have access to your hard disk (unless you start the driver manually later on).

When you press (*not* hold!!) "A" key during bootup, the hard disk driver should load, but the system should boot from A device, that is, floppy disk. This would give you the access to your hard drive, but without starting all those AUTO programs from the drive C. In the same way you may choose different partitions to boot from (D, E... etc, if you have them) so that you may keep different systems on your hard drive - MagiC on C, TOS on D, MiNT on E - and then you could *always* boot in TOS or MagiC, in case there were something wrong with MiNT.

BTW from what I remember from some MiNT 1.12 doc files it is not recommended to use MiNT with TOS 1.0...? I might be wrong, though, maybe someone will correct it. If you have TOS 1.0, why not install MagiC? ;-)

More items for auction:

Forget-Me-Clock II
For the Atari ST and STe, a battery backed clock which
sets the Atari's internal clock each time the computer
is turned on or reset. Uses cartridge port.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=38597&item=3023675979

DEKA Adapter for PC style keyboards
This unit connects to the Atari Mega ST keyboard socket,
and lets you connect an IBM PC compatible keyboard, together
with a standard Atari mouse and joystick. Also works with
the Atari ST using an adapter (needs to be fitted inside
the Atari ST case).

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=38597&item=3023672103

If you plan to buy that one: Don't forget to install the Y2K-bug patch
programs in your autofolder. The FMC-II setting software can't go beyond
Y2K. The clock itself can.

Yes,
Paypal requires no javascript of any kind as I have seen, as I usually
disable javascript on my pc web browsers.

I've made a similar adapter to this, but without a resistor. It has never
caused damage or looked strange or washed out on any monitor I try it on.

Now just to get a monitor that can handle ST-Low and med.

Mark
http://atari-source.com

PS: This is not some sort of go-ahead to build an adapter without the
resistor, I'm just citing my own experiences. Your mileage may vary.

What would be *really* good is if Behne & Behne would either release the code to GPL or at least pass it on to another programmer who does want to continue development (since the rumor I've heard is that they don't intend on continuing development themselves - please let this not be true!). Perhaps the fVDI author? NVDI is such a crucial part of a "modern" Atari system now that it's deadly to the advancement of our platform to just let it fade away without giving it the best possible chance to progress. Sooner or later, the printers we have that do work will break, and we'll be stuck with few or no solutions.

Hi Edward,

>>Say goodbye to "photo quality" prints on a Atari :-(
>
>I do not know about that. Calamus prints out some pretty good
>images and I am just using an Epson Photo 700.

I was discussing the printers which are for sale at the moment... none of the available Epson Photo printers are able to match the output of your printer. Someone who buys one of these printers wont get photo-quality output, and that's a shame of course, especially when one looks at the specs of these printers...

Atari is my preferred platform and as you know I defend it vigourously against anyone who even dares to question it, but that doesn't mean that

I'm blind. Someone who buys a $50 budget printer today for his PC & Mac gets better results then we do. If you have access to a PC or Mac then install Calamus on it, connect your printer, sit back and be amazed... Those "pretty good" images, will all of a sudden be "very good" images. You say that "I am just using a Epson Photo 700", I put it to you that you are unaware of what your printer is capable of. Photo quality means that the output of the printer should be able to compete with the real thing. Digital cameras are getting better all the time, today people can

print pics that really compete with photographs. All we can do on this platform is print "pretty good" images.

The (new) printers discussed in this thread aren't even capable of printing "pretty good" images, and that is not exactly what I call "moving on".
NVDI is outdated, and it shows. Even at its glory days, I wasn't all that impressed with NVDI. The dither routines are a far cry from what could be achieved. We need more then just a couple of new drivers...

Cheers from Belgium

>continue development (since the rumor I've heard is that they don't intend
>on continuing development themselves - please let this not be true!).

It is true... :-(
But then can you blame them? There are still people here using versions 3.0
and 4.0, NVDI just like HD-Driver are IMO essential apps. Last week the
author of HD Driver told us that there aren't even 20 registered users
anymore...

>Perhaps the fVDI author?

What on earth has fVDI got to do with printer drivers?

>NVDI is such a crucial part of a "modern" Atari system now that it's
>deadly to the advancement of our platform to just let it fade away without

>giving it the best possible chance to progress.

We've had our chance, everyone who hasn't updated to version 5.xx or is
using an illegal copy of the software can be blamed IMO. There's a big
aversion here against buying commercial software, at times I've even been
flamed for supporting an opposite view in here !!
I've been told time and time again in here not to expect anything from
commercial developers, all good things would come from the other side, the
side that moves on (sic). I'm still waiting.... so far I haven't seen much
appear yet except for lots of noise and talk. But hey, I'm an optimist, so
like all optimists I'll wait until kingdom comes.

Cheers from Belgium

Source record: 27677

Just a further note on my MagicNet issues...

I went to comp.networking.ppp to see if they had any suggestions. Someone examined my debug log from pppd, and aparently, my ISP is sending an IP packet that is confusing pppd, and it immediately sends a TermReq and disconnects itself. They said that pppd 2.3.11 is incompatible with some newer networks, and if it's possible, upgrade to pppd 2.4.1. I don't suppose that upgrade is possible, since neither MintNet nor NetBSD have anything beyond 2.3.11 that I've seen, is it? From what I gathered from my online searches, much of what's going on is based on the fact that ISP's are using the Microsoft networking "standards" rather than the Unix standards, which makes Unix to Microsoft networking problematic. Unfortunately, as M$'s strangle on the market continues to tighten, I'm sure we'll be forced to switch to that "standard" sooner or later, unfortunately.

2547. Égale 4.01 bug?

Newsgroup: comp.sys.atari.st
Date: 2003-05-11 21:19:46 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3ebecc72732ca0@tripnet.se>
Source record: 27678

Found a corrupted file on my harddisk and this was a good excuse to try out the new (now free) ï¿½gale 4.1.

I have a CD backup of the disk where the file is OK and yes, ï¿½gale was able to detect the differences when comparing just the two files with "Open binary".

I thougt it would be a good idea to let ï¿½gale do a "Tree check" to find out if any other files had ben altered but this operation does not find the corrupted file!

It does however find other files where the content (but not length) has changed inside a subdirectory so it sort of works. Unfortunately this makes ï¿½gale useless/unsafe for comparing backups.

I have made a zip archive with two directories "OK" and "WRONG" to demonstrate this behaviour. I simply can't get ï¿½gale to find that the files inside are different during a tree check.

When comparing the two CABCCLN.TOS using "Open Binary" the differences are found. Strange!

If anyone wants to try this out it is located at

http://atari.mine.nu/egal_err.zip

The DNS at my provider is sometimes really slow so you might have to wait a moment before the download starts.

Also ï¿½gale gets unstable when comparing complete partitions. I have lots of RAM so maybe there are some bugs hidden inside the program.

Hello, thanks for replying to my post. My problem with the ADAP 1 is
not the sampling part. It is the MIDI playback. When I looked at the
diagram in the manual, it looked like the midi controller is in the
part of the ADAP hardware that connects to the cartridge port of the
computer. Do you have a problem to sample, or to playback the sample
via the midi keyboard?
I could send you the version of the software I have. I have version
1.04 and version 1.3.
If you are "fed up" with your ADAP, and lets face it this stuff is
almost 20 years old, let me know. Maybe between the 2 of us we could
get one working system out of it.

I have a Migraph B&W wand scanner for the Atari ST.

It worked fine the last time I used it.

Anyone want it for $10 to cover postage?

Bob

2551. Atari 520ST for sale (in original boxes)

> Oh it is.... very big..... a big con.

All it really is, is the fact that Atari has a big name in the games market, and Infogrames had a lot of trouble with their (lack of) name-fame. So they bought Atari, with the sole purpose of being able to use the name and logo, and make new versions of the game classics. No plans with new tos computers or whatever (we'll have to rely on ACP for that). ;) It does indeed give new fame to the name Atari (although it's more a question on riding on existing fame), but it does strengthen Atari's reputation as being nothing but a game computer. Basically, when I tell people I use Atari stuff in my studio, they know the name now (contrary to a few years ago) but I have to explain them how I can make music with a game computer.

Nontheless, it's kinda cool to see our local computer shop selling their stuff in little Atari bags. :)

Maurits.

2554. Nova/VME drivers?

Newsgroup: comp.sys.atari.st
Date: 2003-05-12 08:55:59 UTC
From: Maurits van de Kamp <james.t.kirk@enterprise.nasa.gov>
Message-ID: <b9nnmjlbd1@reader11.wxs.nl>
Source record: 27685

Hi all,

I have a nova/vme card in my TT and I am wondering if there's a site where I can download the latest (and probably last) ;) version of the drivers. I'm having some trouble with the driver on the disk I got with it.

In case I can't find any other drivers, here's my problem, maybe knows a solution..:) Papyrus can't figure out the correct fontsize for vector fonts on the screen. I can tell Papyrus to use "automatic" settings (fonts will appear 1 millimeter large), or to get it from the graphics driver (same result), or use a fixed setting (fonts will be slightly too large, which will still mess up the format when printing).

According to Rom Logicware, getting a newer Nova driver will solve this problem. So - does anybody have the last version, or does anybody know where to find it, or does anybody have another solution to this problem?

Thanks!

Maurits.

SDMA is now OK after a last bug that Didier saw with a MP3 play.
MP3 play with DSP + Vu-meters = 13 to 19 % of charge.

He may test the new hardware this evening...

For me the CT60 is now shippable for 66/16 MHz versions.

But I have to check 66/20 MHz and 72/16 and 72/20.
And maybe a 24 MHz on falcon : why not.

I have a manual, and it is in English, for version 3.20, 1994.

<quote on>

3. Installation

Copy the program OUTSIDE to your hard disk in the Auto folder. Try to
place OUTSIDE ahead of any other program in the root directory. To check
the order of your programs, turn off the sorting option on your desktop.

<quote off>

MiNT is not mentioned anyplace in the manual. This manual came from
Lexicor Software, and was translated from German to English by Yat Wang
Siu.

Life is getting good...

First we have Infogrames change their name to Atari, Inc. Then I find out that Half-Life 2 (yes, the true sequel!) is coming out in around Sept. or Oct..

Obviously, "Atari" means more than some people think.

Luposian

2 0 21 45 0 0 1c 62 76 0 0 1 2 1c df 3f d7 1a b3 e0 0 0 1 11 64 ee 9b 0
0 0 0
```

Can you find out if the above line is a valid LCP packet? It bears uncanny resemblance to "syslog rcvd [IP data]" does it not? Finding that out is crucial because if it is *not* a valid LCP then your pppd is screwed but if it *is* a valid LCP then I summise that a recompilation of the current pppd will fix it. Deduction logic for valid LCP follows...

Yer gcc has two compilation modes: short/long (16bit/32bit) int. '2e' is ascii period character "." and '32' is ascii "2" (ie ".2"). You stated...

>It's been happening about 95% of the time for the past few weeks,

...and one of the variable factors on a connection is the IP address. Your local IP on the above failed connection is 64.154.138.127 and your remote IP is 63.215.26.179 - there's a ".2" in there and is just so happens that 215 is greater than 127; 128 being the (ahem) f**k-up point for signed/unsigned bugs. If I'm right this may already be ringing bells for someone familiar with the pppd source - split that IP into 63.215 & 26.179 and internally pppd might have it (for network ordering reasons htons etc) as 215.63 & 179.26. The former overflows a signed 16bit and more crucially (for example) is very susceptable to an erroneous ssprint/sscanf format argument.

Whilst I'm busy with daft ideas, here's another...
Connect with the client that works (STiK2?) then see if "route add default" can bodge a connection into life. Probably won't work because you need some way of knobbling STiK2 in such a way as it doesn't drop the connection but only after it has negotiated and given you your local IP address (which is the one to use in "add default"). See also "route delete default". I think you ought to forget this last paragraph even exists! ;-)

Likewise, except for the CDRW. Do you have any reason to believe a
CDR won't be satisfactory? (Except, of course, in three years time
we'll have trouble finding media as everyone will be using DVD+RW.)

I have a 1040 ST which is more or less ok but a little sluggish at times. I would like to run the program on a faster computer if I can. I believe I remember someone saying that Creator would not run on the Falcon. Is this true and, if so, what are my best options?

Thanks,
Garth~

No problem. Only when you would use a HD with more than 8GB you need
HDDRIVER to use the part above 8GB.

From what I got chatting with people in comp.protocols.ppp, it started to look like it was a Windows vs. Unix protocol miscommunication, then people started pointing out that my pppd is generating some pretty strange results, specifically the ones you are referring to. The odd thing: pppd worked perfectly until just was little bit ago, and when I went back and re-installed that MagicNet package, there was no change.

I'll pass this info on to the MagicNet author. The MagicNet version I'm using is a MagicNet 1.4.2 beta version (I think 1.3.9 was that last official release). It might be worth trying to re-install 1.3.9 and see what happens. There were some speed and connection stability issues before, which 1.4.2 was supposed to solve, but that's better than not being able to connect at all! As for 1.4.2, perhaps there's something going on with this compilation that Vassillis is unaware of? But this pretty much confirms what's been said in c.p.p.

> even exists! ;-)

Maybe I will! :) So basically, you're saying I should add "route add default" to my MagicNet setup (where would I put that?), right? Just so you know, I know extremely little about Unix. This MagicNet experiment is wierd for me, in that I'm so GUI-oriented. If it wasn't for the fact that I've also been having difficulties with the other networking stacks, and for the fact that I can use many more clients with MagicNet, I would just say forget it. I'm also about ready to give up on my ISP, as they are *barely* tolerant of Mac user problems, let alone Atari. Anyway, thanks for your input!

Drives with less than 8 GB might still work with AHDI.
As far as HDDRIVER is concerned you can order a copy with an English
manual from Atari Workshop in the UK. Or, if you can read German you can
also order it directly from me.

The latest versions of Outside refer to MiNT in the README. Basically it
worked with MiNT 1.15 (or was it 1.12?) or older, as far as I remember.

I myself am looking for a better SCSI adaptor than my aging SH204. I
would like to hook up my EZ135, Zip100 or Jaz drives to my Atari, and
a nice 4GB HD too. I live in the USA and it is impossible to find any
SCSI adaptors here. I think that if some were avail they would sell
pretty fast! Especially on ebay! Maybe someone should do a limited
run and see how sales go. Maybe even do a package deal with HDDRIVER?
I am sure this would sell. I, for one, would by a combo like that...

Please try to be a bit more correct when posting!

There where 20 _new_ users if I remember correctly. I know at least half a
dozen people in person that own registered copies of HD Driver. Would be
very strange if there only were 15 more in the whole world...

>>Perhaps the fVDI author?

>flamed for supporting an opposite view in here !!

You have been flamed for writing long posts with lots of words but less
thinking...

This is actually history now. Imho it would be all stupid to develop
anything on strict commercial grounds for our platform anymore. In that
respect Uve Seimet is correct that the Atari TOS platform is dead.

On the other hand those who let other forces than money drive them will
still be able to make some money on good products, I hope.

Remember that the userbase gets older and have more money to spend. I myself have put in more money in my Atari gear in later years compared to how much I did spend in the late 80th to early 90th.

Those who return now to the Atari platform just for fun will first not plan to spend any money at all. After some time they will suddenly realize that they want more fun stuff to play with. Software might be harder to sell but I actually think that hardware might have a slowly growing market.

The Link97 would be something that should be able to produce without actually losing money. If sold bundled together with HD Driver his sales might rise as well.

It's hard to tell what's wrong on your system, but I have a Falcon,
running an up-to-date MiNT installation based on EasyMiNT/SpareMiNT,
VI/VIM is working fine, and also vconsd is working with 640*480*256
resolution. (What did you mean with "crazy" ?)

Bonjour :)

For the Eclipse/RageIIc users (and maybe others), there's
a new accessory a bit more user-friendly that replaces the
fvdiacc.acc given in the official fvdi package.

"fVDI Commander" is made to send commands to the fVDI core
or its screen driver. The GFA Basic source is provided

Hello All,

I soon will be having a new email address as well as everything else since AT&T in my areas was bought out by ComCast. ComCast says they will be using GIGAnews for newsgroups. Has anyone here ever used it or know anything about it?

Hello,

I just received my copy of Diamond Edge v2.5 from Anodyne. Runs great on my Hades and look like a real winner in the Atari world. Thank God I now have a program that can optimize my hard drive under Magic and is also compatible with long file names. HD Sentry does not work under Magic or will long file names, so I will use that possibly with my STe which uses mainly TOS.

I was referring to the fact that NVDI is more similar in purpose to fVDI
than it is to any other currently supported software. I thought, if the fVDI
author would be interested, he could completely replace NVDI's VDI functions
with fVDI code (without having to run them concurrently), and possibly
update NVDI's other functions (printing included).

>> NVDI is such a crucial part of a "modern" Atari system now that it's

If I said anything about commercial vs. non-commercial software, I
apologize. That was not my point at all.

> I've been told time and time again in here not to expect anything from

I wasn't going against your side of that argument in any way (and I really
don't want to even get into that at all). I simply believe that if software
authors don't want to support their software anymore, they should ideally
pass it on in some way to someone who does. If that means making it GPL,
freeware or shareware, great. If that means keeping it commercial, great
also. Both are important. I just want vital software to keep advancing if at
all possible, so I can keep enjoying my computer.

```
It's hard to say what appends.
When a file is loaded by VI, the display doesn't work well.
The ':' option is not at the bottom on the screen, it's on the top.
When I quit VI, the prompt is on the top of the screen.

With vconsd, the characters from the keyboard are invisible and
the prompt is not configured for the resolution.

You probably won't have logs from a working connection. Who would but if
you do happen to have one and the IP address from your ISP from that
log doesn't contain a component greater than 127 then it would support
my theory.

It might only be an output error. Internally the data could be correct
and simply displayed wrong. You'd be back to blaming your ISP if that
were the case. I'm sticking with my gut feeling atm otherwise I
wouldn't have written an essay further down. ;-))

I doubt if a reinstall will fix this problem, not if pppd has a bug in
it anyway. Fortunately, unlike windoze the dialler isn't an integral
part of a unix system: in fact its a kludge slung on the side! A
failure in pppd doesn't in itself prevent your network running. Loosely
all it's there for is to get your modem into such a state that it looks
like a network card, then the networking stuff proper can take over.

There are pppd options I know nothing about. FreeBSD pppd manual lists
(amongst others) these...

lcp-echo-failure
lcp-echo-interval
lcp-max-configure
lcp-max-failure
lcp-max-terminate
lcp-restart

...which, if they exist, may allow you to bypass the bug, at the expense
of not being able to detect a hangup from your ISP. I have no idea how
or where to use them. Might have to google for some examples if you
decide to try it.

> give up on my ISP, as they are *barely* tolerant of Mac user problems,
> let alone Atari. Anyway, thanks for your input!

I've never had the opportunity to run an atari unix so will have to assume there's no difference in what follows. The 'route' command is complex and I don't pretend to understand it all but I do use the 'default' option a fair bit. The reason is I have two unix machines here (freebsd), both of which have modems (on one telephone line), either can dial up using either modem and either has to be able to see the internet without affecting the online status of the other, and either has to be able to work when the other is turned on or off.

'route' manipulates your routing tables. These tables describe how network items get wired up. Ordinarily you don't mess with it and you'll almost certainly need to be logged in as the root user if you do. To cut a long story short: if after, trundling through all the tables a connection can't be established you'll get an error - same as if you're not online (even if you are). The "default route" is checked last and probably doesn't exist on a stand-alone machine. When the default route does exist all communications that haven't "been connected" are thrown at it. I'm trying to think of an analogy. All I can come up with is you've got a long set of jump-leads in a car park and able to pick any vehicle you want, to connect your battery to.

Coming back to my pair of machines for a moment. If I'm on machine "sd.swampdog" but machine "hh.swampdog" has already dialled up using its own modem then what I do is change the default route of machine "sd.swampdog" such that it points at the "hh.swampdog" machine. Other things that are irrelevent here ensure that "hh.swampdog" knows what to do with these "alien" connections. I remove the default route from "sd.swampdog" when "hh.swampdog" disconnects its modem. Conversely if machine "hh.swampdog" wants to be online and "sd.swampdog" is already connected then machine "hh.swampdog" manipulates its default route to point at "sd.swampdog".

The idea only works if you can have STiK2 dial up and negotiate the connection to your ISP. That'll get past the buggy LCP phase. Then you must be able to put the STiK2 tcp/ip stack into limbo (or somehow make it die without dropping the modem), perhaps via some 'kill' signal? At this point you can manipulate your default route so that it refers to the IP address handed to STiK2 by your ISP. If at any time the modem hangs up then remove the default route.

So, after all that waffle, it boils down to little more than this...

Dial with STiK2.
Ask STiK2 what the IP address is. Pretend STiK2 says 1.2.3.4
As the root user...

route add default 1.2.3.4

Fire up some network stuff. It'll either work immediately or fail as though still offline (ie idea won't work). Should it fail don't give up immediately, especially if your modem lights are blipping. It might just be misconfiguration of your ISP nameserver(s) addresses.

route delete default

...whenever the modem hangs up.

Try Best Electronics for HD-Driver. The software is well worth the investment. I'm not positive about the HD (my Falcon is in a
Wizztronics Falcon rack, and I have 3.5" SCSI drives), but I think any 2.5" IDE drive will replace the stock drive. There has been a lot
of discussion here about HD driver software, and if I recall the experts said AHDI will only see the first 1 GB. Good luck!

You are correct, Creator will not run on a Falcon, and also will not work with any accelerators that I am aware of. The program depends
highly on the timing of the hardware (which provides a fantastic MIDI resolution, I might add).

I've recently changed resolution on my TT with
Nova card from 70Mhz to 72Mhz and now in the
startup from Calamus something strange occurs:
the image that shows the writing hand is spread
all over the screen in diagonal lines with the
same colorpattern. Has anyone stumbled into
somthing similar and has it got to do with the
Mhz change op is it something else. For the rest
everything seems to work okay but i changed to a
finer resolution (1392 x 1050) for some more
detailed working..

>update NVDI's other functions (printing included).

I agree that it would make much better sense to have a unified driver system,
but failing that the present status quo is almost as good - you only need to
disable NVDI's screen drivers. If I've remembered correctly this can be done
automatically for you.

Printer manufacturers have to be relied on to make their control codes public
for drivers to be written, and they charge...

Cheers

Hey, I just finished a modification & test to boost the ST-RAM write
accesses.
And it runs !
I just win 25% of access time on all ST-RAM write accesses !

Crazy, incredible !!

In 256 colors we go from 5.2 to 7.0 MB/s !
In 16 colors we go from 6.2 to 8.1 MB/s !

And that's only for a 16 MHz falcon, not a 20 or more !

In gembench, kronos or nembench, this gives some incredible results I will
nextly put on my web pages !
It is better than the Milan 040 + 1024*768 video card !!

Why support the crippled "EC" (no MMU), but not the fully-functional but
without-FPU "LC" model?

After all, the missing FPU is easily handled by most software - the missing
MMU in the EC creates difficulties with eg. memory protection in MiNT.

2612. Milan for sale

Newsgroup: comp.sys.atari.st
Date: 2003-05-14 13:12:36 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <3EC240C4.8687A4E9@patent.gov.uk>
Source record: 27643

Hi all,

I want to sell my Milan which I bought from a well known Publisher of a now defunct Atari Mag. at an Atari fair. It has had a SCSI card added, driving a pair of SCSI CD's, one of which is a burner. I have the demo version of Michael Schwingen's driver which allows you to use the CDR only and I understand that he will send the full driver coded for your mother board (for the necessary DM!!). As for the software, basically I have it all. together with crates of printed manuals and docs. There are loads of peripherals: scanner, printer, modem etc. It's really a lorry load job more than a postage one. I also have two Falcons, one a C-LabX with Cubase with dongle and oscillator, that was used with a CDburner in a MegaST casing. There is also a massive 20" RGB monitor that shows of the Falcon a treat.

I haven't used any of the above for years, as I have gone Mac!! so all of the above is for sale at reasonable prices. I won't quote any values, but I have asked around, so if you want anything, make me a realistic offer, I can only say no!!

For collection purposes, I live in south Wales, Abergavenny, and would definitely prefer to demonstrate any goods before taking your money.

I used it on a STFM520 an STF1024 and an STE 4Mo
It ran nicely on the three though for really long and big sequences
and including big sysex dumps for expanders programmation
it was the best on the STE 4Mo of course !
And of course too it was better to have the STE for the bigger floppies ...

Hello again,

I was wrong when I said DE v2.5 had long file name support.
According to Roger Burrows of Anodyne, that will be in the next
version. Right now, DE v2.5 will change the long file names to
shorter version. Other than that, it works great...

>

>where we are still stuck in the dark ages? Your help would be appreciated!
>Thanks!

If you use ZIP23_02.TTP instead of STZIP26 - easiest in
conjunction with Arcview which allows you to just drag&drop the files
to be archived into its window - LFNs will be retained in the ZIP.

Extraction from archives is also drag&drop: I have installed
Arcview on the desktop as an application to open all the usual
archived extenders (ARC, LZH, ZIP, TAR...) so double-clicking on
an archive file loads Arcview which displays the file in its window
from where it can be dragged to any directory window, allowing you
to extract to where you want very quickly and easily.

Regards, /Peter/

Source record: 27504

The LC model is very rare to find ...
And during this last year I received only 1 order for a LC among 150 orders
!
Third, in a technical point of view there is no method to distinguish by
software if you have a EC or a LC and we need to initialize it as a EC (no
PMMU).

Personnally, my point of view is stronger : I think I should propose a
unique product : FULL and nothing else !
It is so better to have total compatibility with all software that will be
done for CT60 !!
I don't want to hear " I get the last demo 'truc' and it is not working
because I have no FPU on my CT60.
Do you remember the 68882 on falcon as an option ?
Because of that a majority of software arrived with 00 code not 030 + 882
code !

In the few days I may decide to cancel the EC version too !

Ok, let me add that I discovered a big non referenced bug into the FULL bus
manager : when using the TCI pin (transfer Cache Inhibit = no cache for the
current transfer), in some circonstances (to be determined), the EC don't
care about the state of this pin and try to fill a line (for longs).
The precise situation for the CT60 is as follows :
By example for the IO on $00Fxxxxx or $FFFxxxxx you have some accesses with
bytes or words from the CPU (TOS and programs).
With the Full , no problems because this address area is Burst Inhbited (TBI
pin inserted by CT60) and Cache Inhibited (TCI pin) !
But with the FULL, I can see a four long transfer with increment of the
A3,A2 addresses.
Hey , accessing to yamaha with this fucking EC get a bus error (except if
you put the STE mode).
Accessing to DSP get a crash of data !
And so on....
The problem that I use the Byte Select pins (BS0...BS3) of the 060 (not
present on 040 !) on ABE to know wich width of transfer is needed to be
proceded into ABE to the F30 mb (1,2or 4 transfers (only for DSP that is the
only one 8-bit device on the F30 -- with 030 CPU there is a dynamic bus
sizer, not on 040/060, so ABE is the bus sizer !), and those BSx are all
four ativated with SIZ1,0 signals too (indicates a BURST) even for a poor
byte transfer.
The EC has a big problem !

Last thing, this problem of hardware into FULL is only when using it in a
PMMU OFF mode.

But IF this problem is on the EC too, sure it will never be usable on a CT60
!!

I just have to test a EC....

Hi Raoul,
I found my graphics cards could get very temperamental with changes in any parameter.
The change in refresh rate is supported by the card?
Can you check the dot-clocks supported by the card (as you can in the ET4000 software).
Are you able to test the new video-mode you created before booting with it?
Is the capability of the monitor being exceeded by increasing the refresh rate at the same resolution? In both vertical and horizontal?
Does your card have sufficient memory to display the higher resolution at the colour depth you're running?
Can I recommend that you use a resolution that is byte-aligned? If you can go up to 1408*1056 or down to 1344*1008 it will be easier for the card to handle it. Each of these figures is divisible by 16 and retains the traditional 4:3 proportion. This proportion isn't absolutely essential, but I would certainly advise you change the vertical to either 1056 or 1040.

regards
Harry

Hi Ed,
So Anodyne is still working on product? I didn't realise this. I've been working (carefully) with v2.04, which I bought from HiSoft (which shows how long it's been since a significant new version came out).

So what else is improved in this version? Any other products upgraded?

Well I tried the Demo and could not get a 8GB to work at all! What is the demo anyway? Just a GUI tease? Does it work at all? I would like to see it in action before I spend any money... Actually more inclined to try the full working version before I buy it.

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

Interesting. If anybody would like to work on that to fix the bug if there
is one, please go ahead and email me. People will need ergo!pro (advisable)
and the GFA development environment.

That's all I can say about it so far...

Best

>and the GFA development environment.

Hm, I have been programming in GFA for many years... and tempted to get
the ergo!pro stuff but been to lazy to actually go through and buy it
from Germany.

I do understand (some) German and know how to program with Face Value so
I guess I would be able to use ergo!pro as well.

If Nick Harlow at 16/32 Systems had software like this on sale I would
for sure have bought it just for fun...

>That's all I can say about it so far...

Thanks for responding!

I did some further tests and it seems that this bug has to do with the
very first byte in a file pair. If the first byte _differs_ the tree
check will always(?) report the files as equal regardless how much they
differ!

If the first byte is equal it works correctly and finds any other
differences.

Unfortunately this makes the tree check function almost useless for
comparing aginst backups. With bigger partitions many files will only
consist of one cluster so it's very likely that there is an error in the
first byte if any.

When comparing a single pair of files everything is OK so the bug only
appears in tree check mode.

I also thought of another useful function that would be nice to have:
A check for file duplicates on a harddisk. By first build a file tree and
calculate checksums and then do a complete comparison among files with
equal checksums it would be possible to get a fast way to find duplicates
regardless of filenames.

Maybe such a tool exists, but would be something a new maintainer of
ï¿½gale could play with.

Does Draconis work in single-TOS (v7.04) on a CT2B Falcon? After booting with the Draconis driver in the Auto folder I get a black screen and the red error messages from the CT2B. Is there an easy way of installing MiNT? One that doesn't require 60 hours of findling with INF files AND works on a CT2B Falcon (which requires NVDI to work!).

Adamas on its own in Magic works fine, its a shame that it won't work with Iconnect! Certainly faster than CAB when displaying JPGs, although this was using a disk based HTML page.

Any ideas from any one would be appreciated!

Neil :-)

There won't be a translated version of DISKUS. The would be an immense
effort, which does not make sense. One or two firms were interested in
the past in doing this, but I warned them that it was too much work.
First they would not believe me but then they had to agree.

Huh? I need to look up the source, but the Milan does distinguish 68LC060
and 68060 - I have both working here. We can not use the EC060 since we need
the MMU, however, I know of one EC060 that worked fine (including the
supposedly missing MMU).

>Personnally, my point of view is stronger : I think I should propose a
>unique product : FULL and nothing else !

If you can get it, the EC060 is a lot cheaper.

>
>In the few days I may decide to cancel the EC version too !

Good idea in terms of compatibility - I would rather cancel the EC first,
since there is a lot more use for the MMU.

I was just wondering if there are technical reasons not to support the LC.

One more reason for the MMU - set up MMU tables that declare the IO space as non-cached, serialized areas and you are fine.

I am not even sure if you can get non-cached, serialized accesses without the MMU - non-cached is possible, but that is not always enough for IO.

I bet there's an international version out there...

The bug you describe sounds reasonably easy to fix. You might need to know
your way around in 68k assembler code...

Anways, if you and/or anyone else would like to take care of the app, please
drop me a line via http://www.reitter-it-media.de

Yes it's done with the Full.

This depends on Diamond Edge. DISKUS uses XHDI and the SCSI Driver interface in order to be able to access any drive indepedant from the hardware. This is why it can also access (and send SCSI commands to, for instance) drives under MagiCMac, the Milan and the Hades without any restrictions.
DISKUS does not use any special function of HDDRIVER, only the standardized interfaces.

Hi all,

does anyone know where I can get a working disk image of Deuteros?
I already have Pompey Pirates disk 100, cracked by Alien, and Debug 098a, cracked by Iceman, but in both of them, the materials required for the dfcc and the drones have been swapped. So the dfcc needs just 2t of titanium etc, and the drones need 120t, which makes the game unplayable.
This was the best game I ever had on my st, I neeeed it...

I too would be interested in one of these, but I would also like to
know the price.
Why don't you put up a user forum on the website for those people that
want one, so that way you can find out how many people are interested.

Guys,
I think instead of a technical debate here, a survey of CT060
purchasers would be a wiser topic. Full versions of the 68060 are
plentiful in the US. I have no idea the cost or availability of the
full version in other parts of the world. I personally have three full
version 68060s, obtained at the cost of $70.00 USD each. If many
purchasers are going to squibble over a few grams of gold in price
differences between EC-LC and RC, then maybe that is an issue. I would
think that ANY prospective CT060 users would want a full version
68060. If benchmarks proved that an EC-LC could out perform an RC
using soft FPU, then there might be an issue, but I doubt that is the
case.
Lets just get the cards shipped, fully functioning with a full version
68060 and be happy. A product that at least supports that
configuration is in no way "crippled".

I've been given a new (used, actually) computer.
Want the following things from the mid-1980s to find a good owner:

520ST computer
SM124 monitor
SF354 disk drive (not working, but may be repairable)
Master2S disk drive
Epson DX20 daisy wheel printer
extra wheels, ribbons, paper for the printer
boxes for the above

In order to choose from among anyone interested, will take highest bid
as of the end of May. Prefer not to ship; so this initial offer is
for the buyer to pick it up. I live in the Denver area.

2663. Falcon IDE laptop drives and autobooting?

Newsgroup: comp.sys.atari.st
Date: 2003-05-16 17:20:14 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vca7efoiq24454@corp.supernews.com>
Source record: 27543

Is there a problem with getting some larger drives to autoboot? I have tried several drives ranging from 4GB to 10GB, brands like IBM, Hitachi and I can't get them to boot. I have been able to get a 60MB Conner and 128MB Seagate drive to autoboot just fine.

I am using SCSI Tools 6.10 (german) and been able to figure it out, not knowing any german! (Is there a patch/hack to make the program in English?)

I can mount the drives and they all work fine, I am keeping the partitions under 1GB. I can mount them all but I have to use a boot disk to enable the HD.

I also initially tried HDDRIVER Demo and it wouldn't work at all. After partitioning it with SCSI Tools it does read the C drive but won't boot either.

Any info would be appreciated!

Tim

2664. Falcon patches?

Newsgroup: comp.sys.atari.st

New Falcon030 owner here! ;)

I have a Falcon030 with 4MB and TOS 4.02. Also installed a 128MB Seagate drive to replace the old 60MB Conner. I would like to add a yet larger drive but am having trouble autobooting from them. (See my other post)

Regarding Patches. What issues do I need to be aware of and what patches are there that I would use to make it more stable? I hear this TOS is buggy!

Also what is FPatch? It was on my HD but causes the startup sound to garble when autobooting.

Thanks
Tim

I agree,
I purchased a 68060 full @60 MHz and 256 meg SDRAM chip. Why?
Well why not!? If you're going to spend $300 to get better
why not spend $350 to get the best. It makes sense to me.

Incessant newsgroup advertisements that don't change in content and really
irritate a lot of people. If you'd like to support that, then sure buy
from Ben. Otherwise I know of other Atari dealers who might be more
deserving of the business.

> this was using a disk based HTML page.

Adamas works with MagicNet, using the Draconis Gateway program, included in the MagicNet archive. It's not the simplest to set up, but once it's set up, it's pretty good. It can use *some* MintNet clients natively (the ones that expect to hook into Mint specifically will have problems), STiK/STiNG clients (with GlueSTiK), Draconis clients (with Drac-GW), and Vassillis (the author of MagicNet) sent me a pre-view version of an I-Connect gateway that seems to work pretty well, too. So basically, with the one client, you can get just about any Atari-based internet client working online. The main issues are figuring out how to set it up. Vassillis is extremely helpful with that.

2673. CTX-HTM and Fret calculator new versions

Newsgroup: comp.sys.atari.st
Date: 2003-05-16 23:10:10 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3ec57dd4b2a5480@tripnet.se>
Source record: 27454

Both my programs Fret Calculator and CTX-HTM have been updated from v 1.0
to v 1.01 today.

Previously these programs did not run with Magic and other modern OS
replacements. It turned out that all that was needed was a recompilation
without the GFA $B+ compilator parameter.

Now both of them seem stable at least with Magic, don't know about the
others...

I have also put up some more screenshots of various windows and dialoges.

Both programs can be downloaded from http://atari.mine.nu/programs/

Hallo Tim!

T>I would like to add a yet larger drive but am having trouble
T>autobooting from them.

You could just do so: Add a drive, keeping the small one in place. That would most likely require a stronger PSU and a larger case, and of course another IDE cable with a second connector (keep it short). But the Falcon can use two drives.

Draconis (1.6) runs fine on my CT2B with its own TOS version.

I haven't tried it online though.

I think it should work. I also have some problems with the Draconis driver, but because I'm using MiNTnet I haven't really tried very hard. But I didn't get the black/red CT2b screen. Did you experiment with the Fastram flags on the draconis.prg driver program ? Use fileinfo.cpx to unset one or both fastram flags (for data and for program.). Has helped me get many problematic programs running on my CT2b.

> Is there an easy way of installing
> MiNT? One that doesn't require 60 hours of findling with INF files AND

It's not difficult to install MiNT, but if you want to use MiNTnet it's getting alittle more complicated. If even the EasyMiNT installation is too much for you, you could try CrippleMiNT. I don't remember the URL but these distributions are the work of Marc-Anton Kehr. You should find a link on http://www.freemint.de to EasyMiNT and CrippleMiNT.

I use the older version of Diamond Edge (2.4) and I've ordered the newer version. I use HDDriver together with D. Edge on my Falcon and Mega STe, without problems.
Diamond Edge 2.4 can't handle big partitions and longer filenames, but this is solved in the newer version.
So, yes it works, no problems with HDDriver.

Source record: 27462

> purchasers are going to squibble over a few grams of gold in price
> differences between EC-LC and RC,

hum, please don't call a FULL 060 as a RC !
It's a mistake !

RC is a suffix that designates a package = Pin Grid Array (PGA) CERAMIC !
For info you could find RP (PGA Plastic !)

All 060 , EC, LC and FULL are ALL RC...!

It's explained on my web page :

EC
XC68EC060RCxx
MC68EC060RCxx
MC68EC060RC75

LC
XC68LC060RCxx
MC68LC060RCxx
MC68060RC75

FULL
XC68060RCxx
MC68060RCxx

Whre xx = speed = 50, 60, 66 (very rare !).
75 MHz versions are only EC and LC; LC is called MC68060RC75 (no LC letters
!).

Thanks for your attention...

If you have a cable modem/ethernet setup, you may want to try
MagicNet. There is an Iconnect gateway for it. I used the Draconis
gateway and it worked fine. Too bad the javascript part of it does
not work too well. I tried to go to some javascript websites and
Adamas either hung or else displayed junk....

Hello Harry,

There is a LONG list on Anodyne's website. Go there and read it. I
am sure you will be surprised. As a registered user, you will be
able to upgrade for I think $10 if you send Anodyne your original
disk. I paid $30 which is still a good price. The speed at which
it optimizes is great. Tood about 5-10 minutes for DE v2.5 to
optimize a 250meg partition.

No, this version does not have that support. That is my mistake
that I made that statement. That support will be in the next
version.

Seems to work just fine. I used it on my boot partition and
eveything is great. Just remember v2.5 is not long-file-name
compatible. The next version will have this support.

Jos V2.5 does handle large paritions, but not long file names.
That will be in the next version. My original statement was wrong.

Well usually when I cannot get to a website it is due to the fact
that it is using Javascript. I thought it was the same thing here.
The fact of the matter is that MintNet works.

I have heard that the Link exist in a special MegaSTE version that you can
exactly put at the same place than the original card made by Atari.
Personaly I didn't get any problem with the internal adaptor. I have a 1Gb
Micropolis drive on it, and it works fine.

I've got a Link 97 in my MegaSTe and chain it to 2 4.5 gig drives a CD-ROM
and a SCSI DAT drive.

That's not the same thing, you're still stuck with Atari resolutions, a VME
card gives an increased choice of colour depth and resolution..

This dongle you refer to is a public domain design, don't pay idiots with
dodgy Lamb chop beard for something that's free.

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

2698. Atari STNICCC 1990/2000/2015 site - including Atari 16-bit Scene Central

Newsgroup: comp.sys.atari.st

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000? Or were you an otherwise active member of the aforementioned scene?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

XC68060RCxx, I stand corrected. It' habit, no one I thought would
consider using another type of CPU other than FPU version. It's a
verbage i've used for a long time, with that mistaken thought in mind.
Are EC's available in the PGA package? Thought motorola said those
were discontinued.

There a page on motorola web site about the 68K devices and the packages...
The last time I checked this page the EC was proposed in EC package...but I
remember an other package was proposed for the 75 MHz version.

2701. Atari is back... now what?

Newsgroup: comp.sys.atari.st
Date: 2003-05-17 16:51:10 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <YJtxa.873$%42.856@fed1read06>
Source record: 27478

Technically speaking, Atari *IS* back. It's gone from being just a brandname "label" slapped onto a software box (to pitch a product), to being a company again... a whole LOT of companies, actually! All over the world, too!

Given this situation, it is *potentially* feasible that Atari, Inc. *MIGHT* now consider expanding beyond just software production/distribution. Especially if the namechange, from Infogrames, boosts their image. Some probably think it might ruin them. Others, like me, hope it will cause them to flourish. I think their stock price will be a decent gauge of that, which recently has gained a few points during E3, from my initial peek over at MSN.

At the very least, they might be willing to consider partnering with a hardware developer (of say... a Lynx II or Jaguar II unit) to then sell the machine with their name on it. Think about it... IIBM manufactured the Jaguar (initially, if not til it's death)! Atari then arranges packaging and advertising through other people. When you think about it, Atari never MADE the Jaguar. They never MADE the boxes. They never MADE the ads. They just got the ideas up and running and handed them off to someone else, and then sold the items through their warehouses.

Man, what I wouldn't do to have every last registration card... THAT'S where you start... by getting back in touch with your past customers. Let them in on what you're doing. Let them have their say-so. Let them decide if you should make game/computer hardware again or not. Afterall... the customer is ALWAYS right!

Advertising... usually a VERY expensive effort. But what of web advertising? Banner ads. Button links (those tiny "Made with..." or "Powered by..." ads) Surely it could be done for VERY little. And the coverage could be vast, considering how many people are "online" these days.

Shoot... Atari could make a Cell phone, I'd buy it in a second! Lynx II? Jaguar II? Same there! Educational toy? My son would get one of those for his birthday or Christmas.

I believe, now, the only lmiting factor to getting the "old Atari" back in the running is simply the planning and offering up of ideas TO Atari. Give them business plans. Give them the view they may not be seeing just yet.

And if it is in their plans to eventually make hardware again... GIVE 'EM ALL THE SUPPORT YOU CAN MUSTER!!!

I believe we are at the beginning of a return to greatness, more than ever before. No longer are we dealing with a company just holding the gonads of the company we want back... they've *BECOME* the company we want back! If

that isn't a vote in our favor, I don't know what is!

Anyone have any thoughts on this? Flames and rude comments directed towards me not withstanding. Constructive remarks only, please.

Luposian

Steve,

Yeah, an adapter that allows the USE of a VGA monitor isn't exactly what I had in mind.

Tony

:)

I would be happy to get one of these interfaces for my second MSTE that has
no HDD.
Wonder if it can be found somewhere ?

How is the TT in terms of compatability, functionality, and graphics. The reason i'm asking is that I like the MegaSTE/TT style case, and I have a stock Falcon that i might want to trade. The TT can hook up to a VGA monitor right out of the box, right?

Greetings,

I know that this should be a complete no-brainer, but I have tried about 5 different 1.44meg floppy drives in my TT and MegaSTE (the TT floppy failed) and I can't find any that will work. I've swapped the cables, swapped the power supply, and taken the working floppy and cable back and forth from machine to machine. No matter what I try, I can't get the other 1.44meg replacement drives to work in either machine at all.

Are there different types of floppy drives? I previously replaced the drive in my MSTE without incident, so has something changed since then?

Heeeeeellllllp!

Thanks :)

What is it doing? are you sure the data cable isn't upside down? if it is
the floppy light will just stay on..

My TT just has a off the shelf PC shop 1.44mb floppy drive in it, plugged it
in and it works perfectly. hardest part is cutting the case to have it fit
correctly.

It just can't read, write, or format any disks. I verified the position
of the cable, and even tried it both ways about ten times. The same
floppy drive works fine on the PC.

> My TT just has a off the shelf PC shop 1.44mb floppy drive in it, plugged it

Infact im certain that's what it is.

See if the drive has the switch or jumper for id setting on its board. I doubt it, it may atleast have solder pads... they used to.

Pc's use cable select, and its bloody unlikely that anyone in this day and age would have 2 floppy drives in a pc!

if all else fails, try a PC floppy cable, the one with the twist. at the last socket after to twist. I don't think Atari's support cable select though.

All you need is a 192K EEprom set with TOS burned in.
The old plain 520ST already has the ROM sockets on the motherboard so all
you need to do is to replace the bootroms with a complete TOS.

Try searching the leftover Atari vendors for a set of TOS 1.4 chips.
That is the latest version that runs in the 520ST without further
modifications. If that fails you can get a TOS image from the net, split
the file into the correct chunks (programs exist for that) and burn them in
to eproms.
Make sure to get the 6 chip set and not the more modern 2 chip one.

HTH,
Matthias

Greetings,

Well, I looked for jumpers or jumper pads with no success. I also tried a PC cable and put the drive on both connectors. On the connector after the twist, TOS doesn't see the drive at all. I tried three floppy mechanisms.

On the first connector behaves the same as before: there is a boot seek where I can hear the floppy click, and on one of the drives the led flashes. Once in TOS, it reports that the disk cannot be read, even though it never spins.

I have four mechanisms in front of me, but the only one that works is the one from the MegaSTE. That still leaves the TT SOL.

Help! How can this be so difficult?

Aha! After scrutinizing each floppy mechanism some more, I located an set of three solder pads that had holes above them, presumably where the jumper pins might have been installed on a previous version of the drive. I soldered a pair of the pads together and that didn't work, so I undid that and soldered together the other pair. Success!

It appears that the old method would allow manual selection, or cable select if the jumper was off. It may be that the cable select method sees the drive as B when plugged into the Atari cable which is the same as the middle connector on a PC cable. In any case, now since I have soldered in the drive A select, all is well.

What a pain!

Anyone else out there with an Atari and a 1.44meg floppy be aware, replacement could require some soldering.

Thanks a bunch!

2730. Creator and Midiman BiPort interface question

Newsgroup: comp.sys.atari.st
Date: 2003-05-18 13:56:23 UTC
From: garthrr@aol.com
Message-ID: <20030518095623.27503.00000068@mb-m24.aol.com>
Source record: 27411

I am running C LAB Creator as my sequencer in my Atari 1040ST. I dont have the "Unitor" unit. For years I have been using a thing called a Synhance MTS1 to write and read FSK to tape and it sends MTC to Creator. Problem is that the MTS1 freezes up a lot and definitely doesnt like it when I shuttle backwords to edit something. So I want to replace the MTS1.

I bought a used Midiman BiPort 2x4s interface. It writes and reads SMPTE and sends out MTC. In its manual it describes my very scenario and says that this is one way to use the unit. Something isn't right however because despite everything I've tried, the sequence will not start playing. The BiPort is receiving valid SMPTE when I start my recorder and something is getting into my computer from the BiPort because I see numbers moving in a small box in the upper left hand of the display but the sequence doesnt start playing. I double checked with the old interface and the sequence played fine so its not a cable or something like that. I hope I have described the problem clearly.

Can someone shed some light?
Thanks,
Garth~

IIRC it's not *that* buggy. I've run all my ST software on the Falcon without
any major problems and certainly not more problems than on the 1040 ST TOS.

>
> Also what is FPatch? It was on my HD but causes the startup sound to garble
> when autobooting.

IIRC it fixes a bug in TOS 4 to make the Falcon sound routines compatible with
software that was programmed for the ST.

Hi,

This isn't a Atari specific question, but it does pertain to my Falcon RGB port! ;)

I bent a pin on the RGB port and was able to bend it back, but it is a little loose and am afraid it will break off at any time! It is the Composite pin, #12.

What do you atari gurus out there recommend I do to remedy this? Once it is broken how can I fix it? Is it fairly easy to solder on another male DB19 connector?

Tim

I have a question. Do I need to insulate the drive on the HD Bracket? I have a IBM 8GB IDE that I have installed, and of course the screw holes are not lined up so I used Elec Tape to hold the drive on the bracket. I also removed the copper grounding plate. It seems to work ok but am concerned I might damage my Falcon!

Thanks
Tim

Message-ID: <926a9946.0305181142.5ca49f3@posting.google.com>
Source record: 27420

Well, last night I killed a Falcon.

I was attempting a recase into a Wizztronics Falcon Rack and what worked perfectly (with the Wizztronics power supply I might add) now doesn't provide a display. (The monitor notices that something is there, but it can't display it.) I have no idea what I did -- microcracking the motherboard, static discharge to a chip, bad ground -- I thought I was taking all precautions, but obviously I wasn't careful enough.

Thus, is there anyone in the US who has had a dead Falcon repaired recently? I've spent so much on getting ready for the CT60 that I'd rather not give up on the project.

Well upon inspection the drive is actually using it's legs to lift the PCB off the bracket like it should, even though it is not screwed on like it should. So it should be ok!

That explains why there was no smoke when I powered up the Falcon030!!! ;)

My opinion is that you'd be throwing your money away investing in ICD software, you can get it just about everywhere for free so who will pay you for an honest copy, also HD-Driver is still under development. I'd try for there hardware though, it would be the only interface in production.

>

I've been using Arcview for some time but I have found that unzip
does not like spaces in the file names and this is quite common
in stuff from PCs (I think it is because of the auto-generated
file name feature in Word etc.)

I have to use a disk editor to replace spaces with underscores in
two places inside each zip file. Then they will extract.

Does everyone else have this problem ?

ALL floppy drive mechanisms sold in the IBM PC market have the drives
jumpered or otherwise pre-set with the Drive Select line set to 1,

This means the drives are ALL set up to be Drive B: from the factory.

On an IBM system, the cable with the "twist" at the end takes care of
reversing the Drive Select lines so the drive on the end connector
responds as the "A:" drive, and the drive connected to the middle
connector then responds as the "B:" drive.

This simplifies things because you don't have to worry about changing
jumpers when you install the drives. In a PC.

The Atari requires its floppy drives to be jumpered as Drive Select 0

Thus an "off the shelf" IBM PC floppy drive will NOT work until its
Drive Select has been changed from the factory pre-set of 1 to the
other position, 0.

Unfortunately, many IBM market floppy drives no longer even HAVE a
selectable Drive Select line, because no one ever changes it.

The manufacturers have stopped wasting money on the jumper posts or
DIP switches they used to use, and many have re-designed the circuit
boards to eliminate the redundant and unnecessary solder pads.

Fortunately, as in this case, SOME drives still have the solder pads
which allow changing the DS line to 0.

It might be, but if they're trying to gauge whether it's worth continuing
the work and find no-one's interested in the first version, maybe they
won't bother. That's been the view of enough companies and that's why
we're where we are today.

If you want to keep them motivated, buy this version ISTM.

If anything, the TT's more compatible with software (not Falcon software obviously) than the Falcon. It came out so early that more stuff was written to support it from the outset.

(S)VGA out of the box, yes. But not Atari monitors except for those 1280*960 ECL monitor thingies.

For those of you who are interested in an auction offering the
following:

- Atari 2600 with wood finish front
- 24 Games (some very hard to find)
- Original Atari 2600 Owners Manual (printed in 1980)
- Original Game Instruction Manuals
- a vintage Video Game Center containment box with wood panel finish
& tinted cover top
- plus more stuff listed on auction site

You can check out the auction I just put up at the following link:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3025299336

I graciously thank you for your time and I hope to see you there :)

A hopeful guess:
Possibly a break in a cable from moving it after sitting in one
position for a long time! If the monitor cable is detachable I'd try
another!

If this is the resolution expander software you might also want to try
Videl Inside, I'm currently using it on my Falcon to run in 800x600 x
256 colours. IIRC it will allow screen resolutions of up to 1200x800 x
True Colour but I think an accellerated graphic card is needed for
that.
I can't remeber where I found it can e-mail you a copy if you want.

>I wasn't going against your side of that argument in any way (and I really
>don't want to even get into that at all).

I know,
It was ment as a message to the guys "from the other side", it's about time
they come forward with something or admit that they can't pull it off. It
would at least let us know where exactly we stand with this platform. Right
now we're all waiting in vain expecting wonderfull stuff to be released,
lets be realistic for once.

>I simply believe that if software
>authors don't want to support their software anymore, they should ideally
>pass it on in some way to someone who does. If that means making it GPL,
>freeware or shareware, great. If that means keeping it commercial, great
>also. Both are important. I just want vital software to keep advancing if
>at all possible, so I can keep enjoying my computer.

If I'm not mistaken some prior commercial software has got the GPL and free-
ware status now. IMO giving software the freeware status doesn't help us
forward, all we get is the same outdated stuff, except that it's free of
course. Passing on software to someone (or a group) who develops it further
sounds nice in theory, in practice however nothing much happens. Just browse
through the posts of the last three years and read all about the nice (?)
stuff claimed to be coming our way....

>> What on earth has fVDI got to do with printer drivers?
>
>I was referring to the fact that NVDI is more similar in purpose to fVDI
>than it is to any other currently supported software. I thought, if the
>fVDI author would be interested, he could completely replace NVDI's VDI
>functions with fVDI code (without having to run them concurrently), and
>possibly update NVDI's other functions (printing included).

We should hear the authors view on this of course, but I don't think its
that simple. fVDI and NVDI both replace the original VDI, but that's where
the comparisation stops. Over the years NVDI has evolved in a printerdriver
and in combination with that dreaded wdialog even in some sort of a TOS
extension. NVDI can also handle most of the popular fonts formats...
Even if the author could implement all of the above and routines to dither
the prints etc... there's still the problem remaining of having to pay the
printer manufacturers for vital information, meaning that fVDI would become
shareware or commercial.... comsidering that people didn't want to pay for
NVDI anymore, what makes you think they would pay for fVDI?

Cheers from Belgium
Dennis

>harder to sell but I actually think that hardware might have a slowly
>growing market.

Ah finally we're back on topic.
The point I was trying to get across is that these people wont be able to
spend their money because the available hardware can't be connected or
driven on the Atari anymore.
Look around!! do you honestly believe that in two years from now there will
still be printers for sale with a centronics port? Try to buy a SCSI writer,
a SCSI CDR or a SCSI scanner these days. The few remaining models wont work
because of no suitable drivers. The new kids in town are called USB and
Firewire.

>The Link97 would be something that should be able to produce without
>actually losing money. If sold bundled together with HD Driver his sales
>might rise as well.

That's like reinventing the wheel, IMO they should produce a link2003, one
that allows to connect USB or Firewire devices. Have you asked yourself why
the production of the Link97 was ceased? If it was so succesfull, it would
still be produced. The same applies to things like the Nova card, Magnum
card, several processor cards, VME ethernet card etc.. at the time that

these were actually for sale, hardly anyone wanted one, now that it's to late, all of a sudden these expansions are sought after like hot cakes. The Link97 is primarily for ST and STE computers, people had five years time to obtain one, to put it bluntly: IMO support for these computers should be stopped at once, people using them should stick to what they've got or upgrade to a Falcon, TT or clone...

>Remember that the userbase gets older and have more money to spend. I
>myself have put in more money in my Atari gear in later years compared to
>how much I did spend in the late 80th to early 90th.

It's not a question of money, it's the attitude that's wrong. To get the people so far that they actually upgrade their hardware is like trying to get water out of a stone. Small example:
On paper everyone wanted a fast Atari with graphic card, IDE and ethernet port, lots of RAM etc... we all had the chance to buy a Milan, and as for money, the basic machine sold for 750 Eur, that's cheaper then what Atari ever charged for the Falcon or TT. I could give you many more examples of brilliant hardware that has been produced for this platform over the years, there's one common factor: they've all failed... the loyal usersbase didn't want to know about it for one reason or another.

Cheers from Belgium
Dennis

2771. CT60 is now at 66 MHz only.

Newsgroup: comp.sys.atari.st
Date: 2003-05-19 15:44:26 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ec8fbcf$0$17330$626a54ce@news.free.fr>
Source record: 27350

Hello,

After long tests at 72 MHz with a 68060RC60 (a 60 MHz version), I consider that running the 060 at 72 MHz (+45% overclocking regarding a 50 MHz model !) is not serious and stable.

In fact the 060 seems running fine on Anyplayer (MP3 playing) and crashed some times after 5 or 10 minutes (there is a cooler on it !) and the temperature is about 22°C.
The problem I already saw at 80 MHz is here at 72 ... : the timing into the internal cache ! Some times some data are corrupted !
It's a vicious and very hazardous phenomena that cannot be really followed and analysed....

What is sure is :
- I will furnish a 66 MHz oscillator to everybody + the 72 MHz oscillator to the first 36 people.
Each of you will do like he wants ! It is sure that some 060 may run at 72 MHz but I let you try.
- I can't officialize a 72 MHz CT60, because it is not professional in term of reliability.
I'm sure 66 MHz is OK, so why trying to crash to win 6 poor MHz ?
- 66 MHz 060 runs fine even without the fan (need the heat sink I furnish stuck on the 060 : some of you that buy themselves the 060 will have to use a thermical stick to fix the heatsink on their 060 !).

- some of you may think to the new 75 Mhz version from motorola but :
no FPU, very expensive and impossible to find as low cost pulls chip; need to buy a new and wait a long delay.
It is preferable to have a full vesion for many reasons...

Regards

And as I said... "To what end?"

The very name "Atari" has become so undervalued and abused over the years (thanks to the Tramiels (towards the end) and Hasbro, I am certain), surely it holds little value or importance to people anymore. So, by simply changing their name TO Atari, that alone shouldn't get them any great deal further in the gaming world.

Besides, why BECOME Atari? What kinda "smokescreen" is that? And why? What do they hope to achive by doing so? Is this a last ditch effort to survive before they go belly-up as well? That would make sense, but then again...

Oh, WHATEVER! I'm tired of trying to figure it out.

Look dude,

These people only do anything if theres money to be made. And lots of it.
They figure that the respect that the Atari name has with innovation will be
transposed onto them and they will use that gained marketing weight to try
and break their own hole in the PS2/Xbox/Cube games market.

Its that simple. Now I suggest you forget about it cos its totally
depressing.

Smeg.

Hi all,

Im trying to format a SCSI drive on my Falcon, I have one from TUS which works fine, though I have tried 3 other SCSI drives in the case and even though my Falcon will find the drive it does not come up in the drive list for when I want to format it, Im using HD8 also. My internal IDE drive coems up everytime, and so does my TUS, but not other drives ? does anyone have any ideas why ?

TIA,
Chris

The only real serious problem with TOS 4.02 is that it doesn't know
where HD partitions end. If you try to put another file on a full
partition, it will write the file OVER the start of the next
partition, which destroys the FAT.

You could use TOS 4.02 to boot TOS 4.04 from disk, or you could just
take care to use large (non-full) partitions.

Traded it for the case. Anyhow, I have confidence in the PS. I ran
the Falcon off of it (via a little extension cable) for several days,
and the multimeter shows it giving off a nice consistent 5.2VDC.

A very good suggestion, but I've thought of that. The Falcon is
generating a signal (the monitor's LED goes to flashing yellow
signalling trouble), but it's not within the multisync's capabilities.
The monitor works fine with my other Falcon. From the video out port
of the dead Falcon I can get a moss green color with some distortion
at the top.

More ideas welcomed.

There are a number of "null-modem" games including chess available.
However, since I've never had another Atari user local to me I haven't
kept them. World Conquest (I think) and a clone of Civilization also
were multi-computer -- I still have the former if you want a copy.

Bonjour :)

New release of the small programs written in GFA Basic
and using pure VDI to run on every Atari.

Download at http://rajah.atari.org (near the fVDI files)
or directly at http://membres.lycos.fr/nef/files/
-> vdi_fx.zip (200Kb).

Added:
- Circles (drawning a square)
- Fractals (Mandelbrot)
- Vectors
- Poink

The GFA sources are given for people interested in GEM coding.

Have fun :)

well maybe, the name Atari is better than Infogames....Infogames does give
the impression that they are educational or whatever, whereas Atari is
Atari...The kids wont know about the history but what the..maybe its all
just about Branding ? But its like telephones...it doesn't matter what you
use to make the call, its the conversation that matters.......so if they
pump out good games, then its an excellent move :)

Best Electronics for starters. There's not that many Atari dealers to
begin with but between DIY documentation, ebay and Best Electronics I'm
relatively certain that if I was an 8bit user I could avoid Ben.

I would support 8bit on my site if I knew anything at all about them, but
I don't and I never will. 16/32 is my thing and I am not as presumptuous
to claim otherwise.

2790. HD Driver 8.11 Problems?

Newsgroup: comp.sys.atari.st
Date: 2003-05-20 04:31:38 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2003.05.20.04.31.38.152525@removenoaspam.atari-source.com>
Source record: 27369

Hello all,

I just got my Cubase Audio Clock in the mail today and I am *impressed* with the extra sound quality achieved by not resampling. But alas I have one issue. My copy of HD-Driver 8.11 seemed to be crashing mp2_player v.997. I tried version .995 and had a boatload of additional problems with it (randomly crashing 3 seconds into a song requiring a reboot!). 0.997 worked fine except it just kind of stopped. A soft reboot allowed only the ide bus to work, but the scsi seemed to be dead. Switching to my copy of 7.93 fixed the problem right up. Anyone else know what other software might have issues with 8.11?

PS: While I'm at it. Anyone know of any way I could run Newbeat productions software under MagiC? Flextrax, ace midi and ace tracker work fine until the file selector dialog is brought up for loading. It then proceeds to kill the machine. MiNT is painfully slow on my Falcon so I avoid it like the plague (I'm not a MiNT hater, I couldn't see using anything else on my TT).

Thanks
Mark

Any software that does not use the SCSI driver interface to access the
SCSI hardware on a low level basis may cause problems. That's in
particular the problem with Cubase, which is not SCSI-compliant to the
level it should be.

2793. Notator Logic (log3) in the UK

Newsgroup: comp.sys.atari.st
Date: 2003-05-20 08:52:03 UTC
From: Rob <rob19@eggconnect.net>
Message-ID: <eoqjcv0og2ejvdat4lpoa4bsci7trak2j0@4ax.com>
Source record: 27371

Hi all. Pardon my intrusion.

I have for sale notator logic. It is the Log 3 dongle, the manual and addemdum, and the logic disks (though the disks are not the original disks, they do contain the legitimate program)
All of this comes in the hard backed case.

For those of you that are unaware, the log 3 is a dongle, that also has 3 extra midi outs (4 really, but one is duplicated)

The log 3 allows you to use notator 3.21 or notator logic.(Both of these can be downloaded from the internet, though obviously requiring the Log 3

I have two copies of this now, and as cubase is more my flavour, I have decided to sell a copy. By all means make me an offer (I can only say no), though I shortly plan to put it up on ebay, if I haven't heard from anyone.

Thanks... Rob

Atari sold a color monitor for the TT under the Atari name, the PTC 1426. I believe it was made by Phillips.

I'm planning on selling this monitor on Ebay as I don't use it anymore, just the B%W monitor. If anyone would like it, make me a decent offer.

Hi Tim!

You won't be surprised to hear it's HDDRIVER :-) You just run
HDDRUTIL.APP from floppy and use the program to install it on the
hard drive with the 'Install HDDRIVER' menu entry. After that you
should be able to boot automatically off the hard drive.

Other drivers use a similar procedure.

I have no idea. And I wouldn't know how to check with them about that. This ISP is so incredibly Microsoft-oriented. The only way to get any TCP/IP details from them is by an online form, online chat, or phone call. When you use the online form, you have to specify whether you are using Windows or Mac, what version of Windows or MacOS you use, and what specific software you use (they mostly only give Microsoft-based options). Then, if they reply at all, they'll let you know what info to put where in the specific program, and nothing else. If you call or use the online chat, they follow a script, asking you the same details as the online form, and tell you things like, "In Outlook Express, go to X menu, select Y, and enter Z in this field...". If you try to tell them that you use anything else, they just say they can't support that. When you just ask for more specific TCP/IP information, they either try to read back through their script, or can't give you any information. Even if you give them the exact settings you have to see if they are correct, they try to take you through the entire script (even for info you told them you already have in the right place). So, I've already found some possible ISP replacements that actually offer useful information online, and as soon as I can, I'm gonna ditch these guys.

I agree. If anyone has an old copy of Diamond Edge or is considering
buying it for the first time then I would urge them to do so.

I bought Extendos and CD Writer suite a couple of years ago and Anodyne
have released loads of updates with extensions (and the odd bug fix) all
for free. IMO it was money well spent.

Don't misunderstand me. I like free software, some of it is excellent
but I don't mind paying for good, supported sofware either.

Newer versions of NOVA drivers do not support ET4000 chipset, they are
written for Mach32 or Mach64. I don't know which version the change was made
with. So if you have really old drivers and they work, the new ones will not
work.

Anyway, I wanted to say http://home.t-online.de/home/s.curcic/NOVA.ZIP :-)

Steve, if you're reading this, I've replied several times to your emails regarding the auction for "ASSEMBLER EDITOR" cartridge Atari 400/800. Since you haven't replied to any of these I'm assuming there could be something wrong with your email. Do you have another address I could contact you on? (email it to me if you do).

Sorry to bother you all with this.

> through the posts of the last three years and read all about the nice (?)
> stuff claimed to be coming our way....

Well, I really haven't seen much commercial software passed on to be able to
really judge that, personally. I've seen much more freeware stuff actually
passed on and continued. And the few commercial pieces passed on have been
continued in a reasonable way so far. As for the freeware vs. commercial
debate, I don't like getting into that argument because I don't take quite a
black and white view of it. I think both are important in their own way to
the development of the platform. I've seen just as much promised
commercially as has been promised for free that has failed to go anywhere,
as well as software in both arenas that keeps pushing the limits of our
machines and keeps us using these systems.

To me, a commercial piece of software *must* be of a high calibur, or I'm
not wasting my money on it. If better software can be had for free or
through other commercial releases, then that tells me that something is
extremely lacking on that commercial software's end, and it's not worth my
money. Ideally, I'd love to support every Atari author out there, but
financially, I have to make the best choices for me and my family. However,
there are a number of really top-notch software that's commercial that I
would gladly spend my money to support. Examples of both: Light of Adamas
(when it was commercial) wasn't nearly as stable or full-featured as other
similar software (namely CAB). On the other hand, Papyrus is an extremely
elegant and feature-packed program that, while it's not perfect, is far
superior to anything similar available for free, and arguably better than
other commercial software of that genre (on more than just our platform).

Anyway, back to the topic at hand, there have been a *few* exceptions of
programs that have been taken over by other people, both freeware/shareware
and commercial, that are being updated. Diamond Edge, XaAES, TeraDesk, and
Highwire to name a few. Also, the Draconis software (not that it's really
the greatest thing, either) has seen many more updates recently than I've
ever seen in it since it's been declared "freeware". We'll see if any of
these goes anywhere, but at least there's development. What bothers me is
when software like NVDI, CAB, etc. that people (who own legal copies) have
paid fair amounts of money for suddenly stop development, and the code just

sits and decays away on the author's hard drive, if not deleted altogether. Whether or not it's the fault of people not buying it because they expect something for nothing, or just lack of interest on the author's part is irrelevant to me. The development of key components of the computers we love to use has been killed off, and there's nothing we can really do about it. Starting over from scratch like so many have tried puts us that much futher behind. Releasing the code to people who care enough about the platform to push forward is the only way we have any chance of progress. Whether those people continue it in a commercial or freeware/shareware form is also irrelevant. That's their choice to do the work for free or not - as long as it gets done.

> We should hear the authors view on this of course, but I don't think its
> that simple. fVDI and NVDI both replace the original VDI, but that's where
> the comparisation stops. Over the years NVDI has evolved in a printerdriver

That's true I guess I was being a little too simplistic in that suggestion.

> Even if the author could implement all of the above and routines to dither
> the prints etc... there's still the problem remaining of having to pay the
> printer manufacturers for vital information, meaning that fVDI would become
> shareware or commercial.... comsidering that people didn't want to pay for
> NVDI anymore, what makes you think they would pay for fVDI?

But what else are we going to do? Sit and let vitally necessary software die? The only other way I can think of to remedy this problem would be to find some way to make a very rudimentary emulator that can load Windows or Mac printer drivers from the printer's driver CD's and emulate only what's absolutely necessary to run just that. But I would guess that'd be technically difficult (if not impossible) and slow on our machines. So we either get the authors to pass their software on to someone who can afford to make the necessary updates, or we sit here discussing why the software has died while our beloved machines fade into useless piles of silicon and plastic. Which would you prefer?

Wow, I asked that question a while ago.
It would be for a falcon (cubase audio only works on that - well, from an audio point of view)
I do realise now though that the TT's and also the mega STe's can also have FPU's.
The reason I asked the question, was because I was thinking that having an FPU may make the falcon work quicker (shared workload across the processor and FPU) and that it may just appear that bit quicker (P4 Falcon anyone? joking obviously)

That said, the start of a new thread, wanting to use my falc for music making purposes, could I fit an accelerator, or rather, is an accelerator compatible with cubase / notator

Well I just installed a 68882 25Mhz PLCC chip in my Falcon030 from an old dead Amiga 4000/030 Rev D MB ;) Works fine. Though it is running at 16Mhz now.

I doesn't make the computer faster, it just allows special software that takes advantage of a FPU work, and run faster. So if you didn't have a FPU installed that software would run slower! Usually Fractal Rendering programs or other similar programs. Not sure about Cubase but I am guessing No on that, check your manual.

CT60 is rumored to be compatible to Cubase Audio. That of course has yet to
be seen as far as I know, but it'll be very cool if it is!

As for an FPU, I don't think it does anything for Cubase. There's really not
much it *is* used for, unless you want to run Linux, Ghostscript or other
specially compiled math-heavy software, or some software designed for the TT
which uses the FPU. I would love to see more done with it, though, since my
Falcon has one. My suggestion would be, make a list of everything you want
to do with the Falcon, figure out what software you need to do it, and see
how much of that uses an FPU. If the amount of software that uses it
outweighs the cost of getting one, then go for it! If not, it's not that big
a deal if you don't have one. Although, when you do run into the odd program
that uses it, it's pretty nice.

Well, as for games that's simply not true and Infogrames has already proven that. The major part of the world only knows Atari from Pac Man, Space Invaders and the VCS2600 and have never heard of STs, TTs, Falcons or TTs.

Whenever there's an "Atari" game commercial shown on a TV in pubs etc, I see a lot of recognition from people I never expected it from. :)

> So, by simply
> changing their name TO Atari, that alone shouldn't get them any great deal
> further in the gaming world.

It already has actually.. at least I see a lot more activity from them since they changed their name, and a lot of people notice them just because of their interesting new name.

> Besides, why BECOME Atari? What kinda "smokescreen" is that? And why?
> What do they hope to achive by doing so?

The smokescreen of name-fame. Atari is the inventor of the computer game, and now they are publishing games again. This gives the customer the feeling that they are dealing with the pro. In fact, this is a very common marketing technique (often also used the other way around; like Philips using the names Erres and Aristona to produce cheap crap they do NOT want associated with the rest of their products).

> Is this a last ditch effort to
> survive before they go belly-up as well? That would make sense, but then
> again...

Actually they seem to be doing pretty well so far, lots of advertising, helped by the fact that game shops enjoy hanging big Atari signs on their walls and shop windows, again the new name helps here (the name Atari has a major cult status). I'm not sure if all the advertising is paid from a big bank loan or if they are already making enough money to pay for all this. Anyway, marketingwise, the new Atari is doing a much

better job than the old Infogrames and certainly the old Atari.

> Oh, WHATEVER! I'm tired of trying to figure it out.

That's why I'm explaining it. :)

So, beyond just the "technicality" name change, do you think there is any chance that they might go into hardware at all, in the future? Gaming or computer?

Do you think they could be encouraged in this regard any more than before? Or do you think we're stuck with "AtariSoft" (anyone remember *that* period in Atari's history?) forever?

> Or do you think we're stuck with "AtariSoft" (anyone remember *that* period
> in Atari's history?) forever?

The thing to remember here is: The original "Atari" began as a hardware making company. That required them to support their hardware with software. Infogrames (now "Atari") began and still is completely a software-based company, whose software already has its hardware goals more than adequately accomplished by other companies. They have absolutely no reason and no incentive to make hardware, as the original Atari did to make software. Why would they want to turn to outdated designs (even if they were good designs) which are compatible with no other existing modern machine and have very little existing software support, and spend the R&D money on such a risky venture, when they have all the hardware support they need, furnished at the expense of someone else?

I would love to see new "Atari" hardware as much as the next guy, but I don't see this new "Atari" giving us any satisfaction in that direction. The only possible way would be if someone made some incredible new Atari-compatible machine that beats out any other machine on the market (hardware-spec-wise) at a price that no one else can beat, is willing to invest in a *HUGE* software development project, and is willing to spend all the money on advertising and development of these systems. Then, "Atari" *might* be willing to *investigate* the prospect of *sharing* its name for a *pricey fee*. But personally, I don't think any of that is even possible now. So I would say, forget about this line of thinking and focus your energy on what we do have as a platform, and build on that. Atari is just a name anyway. It's the hardware and software itself that counts, no matter what label you slap on it.

Well Infrogrammes is no way big enough for this. Its now in the hands of the
huge resource sucking companies, like Microsoft, Sony, and to an extent,
Nintendo. You need the sort of money that Microsoft has in order to even
think about this sort of thing. Nintendo have been in the business for years
so they can afford smaller R+D budgets, Sony and Microsoft both are relative
new-comers and look at how much money they have had to plow into thier
respective dogpiles. Remember Sega. RIP.

>Does everyone else have this problem ?

I have just tried Arcview with ZIP23_02 on filenames containing spaces both before and after the point. In each case they were zipped and unzipped again correctly, though the process seemed to take a lot longer than with 'normal' files. Egale showed that the files were equal to the original after unzipping (though the spaces had to be removed to load them into Egale, which handles LFNs but not those with spaces).

Are you using this latest version of ZIP (ZIP 2.3, Nov 29th 1999)?

Regards, /Peter/

Single Player, Atari ST, Amiga, Mac, Direct (null modem), over phone
lines (dog fight only against another computer) and mostly useable on the
Falcon 030 with Backward III :)
In case someone is interested, on the 030 don't hit the ESC key (crash)
and as soon as possible disable the sound from the drop down menu until at
the "take off" screen then hit the "S" key.
And if I'm not mistaken, Bacward II settings are no caches, ST mode,
Spec., 8mz, hard disk on, sound off (last 2 may be in reverse).

2834. CT60 with 512 MB !

Newsgroup: comp.sys.atari.st
Date: 2003-05-21 23:25:01 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ecc0abb$0$12435$626a54ce@news.free.fr>
Source record: 27266

I passed 3 days on the SDR60 chip to change some things inside :
- CT60 now accepts 512 MB DIMM !
- CT60 is faster : Page Miss were increased by 1 clock cycle :
R/W = 12/10 instead of 13/11

Here are some tests with Nembench 2.1 (same results with Kronos !) in VGA
256 colors :

Linear 32 bit Read ST-RAM : 4.425 MB/s
Linear 32 bit Write ST-RAM : 6.194 MB/s (!)
Linear 32 bit Copy ST-RAM : 2.580 MB/s

Linear 32 bit Read SDRAM : 69.167 MB/s
Linear 32 bit Write SDRAM : 61.248 MB/s
Linear 32 bit Copy SDRAM : 27.193 MB/s

Ok, try to do better with your TOS clone... ;-)

As you (and I) feared, emulator.prg says "Sorry, NOVA is too old" and exits. After that, the tt starts throwing bombs at me like an American. ;)

So, another plea to anybody out there: Does anybody know a fix to the fontsize-problem (vectorfonts displayed microscopically small on the screen in Papyrus with the Nova) or does anybody have a Nova driver that will work with the old ET-4000 chipset? :)

Maurits.

I'm not sure I remember correctly (actually the sellout of Hasbro to
Infogrames happened quite a while ago), but I think like Hasbro they
actually "promised" not to do anything at all with TOS and the likes,
and consequently not bother the Milan team with copyright issues.

Besides, Infogrames is nothing but a team of game programmers, they
don't have the resources to develop a new computer.

> Do you think they could be encouraged in this regard any more than before?

I think it's the wrong kind of company. :)

> Or do you think we're stuck with "AtariSoft" (anyone remember *that* period
> in Atari's history?) forever?

Or "Atari Interactive"? :) Perhaps, but this time with more success and
marketing capabilities. ;)

Maurits.

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

Yes, I have used the VANTAGE 2000 card with Cubase Audio 2.06 for my C-lab
Falcon mkII (with FPU), and it worked fine. The card accelerates the speed to
32 MHz (and installs 14 MB RAM). I cannot understand how I could use CAF
without the accelerator. It's on the edge of being too slow even *with* the accelerator.
We're talking 8/16 tracks of audio with Cubase Audio's effects and say 15-20 tracks
of MIDI at the same time. Even though the DSP takes care of the audio, the
computer must read the audio from disk and play the MIDI tracks. I think 32 MHz
speed is needed in order to get a decent system running.

AFAIK it is caused by a wrong pixel height/width setting in the NOVA driver. I had a similar problem when I used Atari TT with a graphic card. Newer versions of the NOVA driver support an additional variable in the config file to set pixel size, but the one I used didn't - so I had to patch the driver :-) but it was lost together with my TT long ago...

Anyway, the incorrect vector font size problem can be fixed, if you are really determined to try doing it, please contact me via e-mail (I guess your e-mail address is fake ;-)) E-mail: gregory (at) atari (dot) pl

Not by any means a guru, but...

a) if you use a VGA monitor, you really don't need the composite pin

b) unless you move the computer, you won't put any strain on the
connector

You might try placing a very narrow M/M (or F/F, whichever works)
adapter on the port followed by the reverse gender. This will extend
your port by about 3/4 inch, but will take the strain off the pin.

2852. Degrading Falcon030 to play ST games?

Newsgroup: comp.sys.atari.st
Date: 2003-05-22 18:49:49 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vcq6uffurl5t1d@corp.supernews.com>
Source record: 27284
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a falcon030, and a lot of ST games do not work. Some will work from floppy if I boot to the disk and set ST Low.

What software degraders out there allow to get some of those old ST games to run?

I tried Backward III I think it was and was unable to get it to work. It should not be that difficult! It was the demo version, not sure if that was the problem. How do you use this program to do a generic degrade of the machine? I don't want to mess with config files, naming configs etc. Too much work.

On my Amiga 1200 it is fairly easy to degrade to get older games to work, I am hoping the Falcon030 has something similar.

Thanks
Tim

The Nova card I sent to Ozk used the old ET-4000 chipset, it was the
TT version of the software.

At one point he was having some e-mail problems. And then sometimes he just takes a while responding. Try sending him the request again.

> Presumably with MagxNet installed I can use both Draconis Dialer or
> Iconnect to Connect. And then use Adamas/Marathon or CAB/Emailer to
> surf/email? What are the other options?

Not quite. You use MagXNet's PPPD-GEM dialer to connect (not Draconis or Iconnect's Dialer). Then, assuming you have everything set up correctly, and all gateway programs have been run, simply run any of the compatible clients and it should work straight away, as if it were being run on it's own drivers. At least it did for me. You can use any STiK/STiNG, Draconis, or I-Connect client (or server) program out there with the GlueSTiK, DracGW, and IConGW gateways all installed, as well as some MintNet clients natively through MagXNet itself. You can also use them all with full networking, if you've got a network of some type set up (i.e. Ethernet) as long as the appropriate MagXNet drivers are available.

>>with the Draconis driver in the Auto folder I get a black screen and
>the
>>red error messages from the CT2B.
>
>Draconis (1.6) runs fine on my CT2B with its own TOS version.
Following someone else's suggestion I changed the Fast Ram bits on the Draconis Auto-folder program (Fastload-SET, TT-Ram(Mem)-SET & TT-Ram(Prg)-NOT SET). This seemed to get it to load.

I can dial Freeserve (I think) and it seems to connect OK, I load in Adamas. In the URL selection box I type www.google.com press RETURN. Nothing happens.

In desperation I looked at my old STiNG script and found the HTTP_PROXY & HTTP_PROXY_PORT entries and entered them in the relevant part of the configuration program. www-cache.freeserve.net 8080
No joy there either! It displays "www-cache.freeserve.net" in the grey box in the top right of the window, but nothing else goes on!

I tried Marathon next, seems to bail out complaining about problems connecting to the POP3 server (pop.freeserve.net). Hmm.
>
>I haven't tried it online though.
Don't bother is the answer it seems...
>
>>Adamas on its own in Magic works fine, its a shame that it won't work
>>with Iconnect!
>
>Install MagxNet with the Draconis and IConnect gateways.
I tried emailing Vassilis months ago about the Iconnect gateway but no reply from him, do you have an up-to-date email address or can you give me the program?

Presumably with MagxNet installed I can use both Draconis Dialer or Iconnect to Connect. And then use Adamas/Marathon or CAB/Emailer to surf/email? What are the other options?

Thanks for your patience!

Neil :-)

Hi Maurits,

>Hmm no, nothing there.. any other suggestions? :)

Yes, get in touch with me and I'll mail them over. I have the Nova 2.67
drivers for the Mach32 and Mach64 cards right here, TT & MegaSTe and Falcon
versions...

If you need the full installation disk (copyright) then mail Gerhard Huber
(the programmer) stating the serial number of the Nova interface and he'll
pass them on to you...
mailto:gerhard.huber@pl32.com

>So, another plea to anybody out there: Does anybody know a fix to the
>fontsize-problem (vectorfonts displayed microscopically small on the
>screen in Papyrus with the Nova)

In the "compatibility" settings, force Papyrus to use the memory.sys driver
and the 93DPI settings. According to R.O.M this should solve the problem of
the small fonts with older drivers of the NOVA card. Since this problem only
occurs with Papyrus IMO it's one of the many unresolved Papyrus bugs ;-)

Cheers from Belgium
Dennis

Make sure that the DNS is working. You can check it with the tool DRACINFO
after establishing the connection that there is a valid DNS-Ip. Also make sure
to disable the STING.PRG in the AUTO folder, because it removes sometimes
characters from the COM-Port, which result in dropping the data packages due
to checksum errors. (This happens, even if STING is not active)

Couldn't have phrased it better.... BTW that total kit even with software
is around 25pounds UK.... I mean I sell 4Mb STE's for 45...

Dream on

Yes, that is true. I am glad they did. The Atari community needed
something like this. I only hope the next version with long-file
name support comes quickly.

I have an IDE drive in my Hades and an external SCSI. Sometimes I
also have the same problem in that my external SCSI does not show
up. I usually keep re-booting and eventually it boots up. Do you
have the SCSI device set in the settings of HDDriver? Look in the
"Settings" drop down menu under "Devices and Paritions". If your
SCSI drive has a SCSI number of 2, then you should have the box
"1.2" higlighted. That may not be the problem, but it is worth a
check.

On a similar note, is it possible to sufficiently upgrade an STE to run Falcon games? I know very little about Falcons, but I gather they use the same OS.....or would that just be too much to hope for?

Well if the game was written for the Falcon specifically then NO. As the Falcon has better sound and graphics capabilities. 16bit audio and True Color graphics will not work on the STE.

Although I can't help you with your question, I prefer Fastboot.tos
which installs itself on the boot sector of the floppy so all is needed is
to remove or change the floppy disk. Not sure if it bypasses the IDE check!

Seeing as everyone's top-posting ;-) .....

The Falcon and the STE are very different machines. The Falcon only has a few devices in common with the STE, the PSG sound and the keyboard/midi chips spring to mind. The CPU (68030) and the VIDEL (video shifter) are not in the STE but these chips can perform most of the STE's functions. All properly written software will work (IE if they use the GEMDOS/BIOS functions, and dont write directly to the hardware (like GAMES!)). Its not surprising really that most games wont run on the Falcon, in order to bring out a computer that was sufficiently ahead of the STE at the time, compromises in terms of compatibility had to be made.

To answer the question though, the only games software that will work on both platforms is either a Falcon game that has an ST/E mode, or an ST/E game that will work with Backwards. Not many ST/E games will. Im sure there is a list somewhere of tested ST/E games with backwards, but I cant remember where I saw it.

Smeg.

2887. [Web] The Unofficial XaAES Page

Newsgroup: comp.sys.atari.st
Date: 2003-05-24 00:56:13 UTC
From: GokMasE <fake@email.se>
Message-ID: <Usenet.aoqfmegk@localhost>
Source record: 27318

Hi all,

When XaAES, the freeware AES for MiNT, was integrated with the FreeMiNT CVS a while ago, it opened up possibilities for better coordinated efforts when it comes to updating the sources. And it surely has proved to be worth that effort! Recent patches has most noticably improved the mouse response and also cured a few other quirks. But as not everyone can use CVS and compile their own binaries there has been a need for a place where test builds can be downloaded, and where information on the project in general can be presented.

To fill that void, the unoffical XaAES page has been created. It is by no means complete, and lots of things will surely be added along the way, but you can already get the latest binaries (030) and also share your thoughts on XaAES with others on the site forum. In the near future you'll be able to browse docs, and check out screenshots on the new site.

The most recent development snapshot is dated April 23, and contains a bugfix that should allow Interface to run under XaAES again.

Well after a lot of surfing I found a util that will indeed turn it on and
off! ;)

If anyone wants it, here it is:

http://files.dhs.nu/files_util/mem-test.zip

Thanks
Tim

Just yell at it-

"Your father was Jack Tramiel and your mother's name was Leonard..!"

"Your parents never really loved you, or else they would have marketed
you more successfully..!"

"They really wanted an Amiga, but got stuck with you..!"

That should be pretty degrading.

I'm searching for an ST program that can read data from the parallel port and act exactly as a printer. I would like to capture printouts from an old computer with no other interfaces to salvage some source code.

The alternative is to print on paper and then use a scanner and OCR but it takes a lot of time and some OCR errors might ruin the sources.

It should be possible to read the printer port but what about manipulating the (crossed) strobe/busy lines?

Does anyone knows of such a "printer emulator" program and where to download it?

If not, I might even try to write one myself. It is possible to read the printer port but I'm uncertain if it will work to simulate the strobe/busy handshaking by manipulating the sound chip registers.

I tried this a long time ago and managed to read the first byte in GFA but never got the other computer to send any more data. Maybe all that is needed is a small ASM routine to toggle the handshaking so the built in routine can read the next byte?

If anyone knows of a similair solution for PC I can use that as an alternative. Perhaps even better as this eliminates the risk to blow the Atari printer port...

Sounds like a rather round about way to save some files. But if I was to make a suggestion, I'd setup the machine for a serial printer. I've never dealt with the parallel port, but the serial port I've done alot with. Maybe a cpx or some old desk acc from Atari would let you set the port for sending stuff to a printer. It's an idea anyway.

This computer has two ways of sending data:

1. Parallel port in ASCII format.

2. 300 baud analog suitable to record on a cassette tape.

So, I prefer the first method...

This definitely is possible. PARCP uses the printer port for transfers
and so does the Portfolio and STBook data transfer utilities.

I don't need any high transfer speeds, only error free.

I have found some hints on Google about how it might be done.

To my surprise a search for a PC program capable of this returned
nothing...

There might also be a possibility to use a parallel to serial converter
but I guess those are both hard to find and expensive.

I have been considering using the same technique but across the serial port
to get data from one of my antiques, a Camputers Lynx.

The serial port is slightly non-standard so I will have to make up a lead
and I don't know what software to use. Would a terminal program do the trick ?

Regards,

Peter

Unfortunately all the PC zip files on my Milan have all ready been
doctored so I have been trying to find one on the net. Here is
a music file that has been zipped:

http://search.mp3sound.com/download.php?id=4266050&template=new

When I open it in Arcview it looks ok but when I drag the file into
a folder these errors appear and nothing is extracted by Unzip

caution: filename not matched: Kylie
caution: filename not matched: Minogue
caution: filename not matched: -
caution: filename not matched: Spinning
caution: filename not matched: Around.mp3

Ok it's not my choice of music.

Peter

2904. CT60 : SDR is evoluating

Newsgroup: comp.sys.atari.st
Date: 2003-05-24 20:25:25 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ecfd51b$0$4619$626a54ce@news.free.fr>
Source record: 27335

I spend my all time on the SDRAM controller to increase the perf with a good margin of timing security, sure.

I just have now 74MB/s with Reads and 69 MB/s with Writes...nice but I will try to eliminate a other cycle for reads.
An other try is to registered TWO different page (not contiguous) to have page hits on 2 different addresses; like this the CPU can move data from a source to a destination , both in page hit accesses.
I'm not sure to success in this way because of the fitting of the logic into the chip ...

Some of my solutions are :
- fix the HIT page size for all DIMM (some get 2KB and some get 4KB).
- eliminate some case into the logic : the DIMM 32 MB are obsolet, I could remove the support and propose only 64, 128 , 256 and 512 MB.

Consider that the price of a 128 MB is so low...and I'm not sure you can yet buy a 32 MB SDRAM dimm .
Ok, some of you had maybe get a such DIMM ?

Heyn what do you prefer : SDRAM nice speed with possibility of 32 poor MB up to 512 or
SDRAM better speed with 64 to 512 MB ??

I know the answer...(I think to know)..

2905. Atari ST game title

Hello people,
I'm looking for a game title; in the game, you drive a police car and you have to stop cars of certain criminals. It was a top-view game. Mission started with a briefing with pictures of the suspect and the car he was driving. After missions, you had to shake up the suspect and get the information before the police chief decended from the stairs to check up on you and the suspect..
It was a very nice game then, and i would very much want to play it again for old times sake.
Anyone?
Thanks.

2906. Falcon030 and PC Zip/Jaz/EZ135 access?

I would like to transfer some data between my PC and Falcon030. I have a Zip100, Jaz 2GB, and EZ135 SCSI drives that I can use. Which ever is easiest.

How can I mount one of these drives on the Falcon and see the drive?

I tried using the EZ135 since it is a smaller drive and formatted it with FAT on PC, now I need to know how to have it mount on the Falcon.

I am using SCSI-Tools 6.10 on the Falcon and TOS 4.02

Thanks
Tim

I you get the cable correctly made, and the machines can match each other on
the serial settings, that should do nicely. Turn on the text capture and
it should be able to save the data.

Hallo Kenneth!

KM>I'm searching for an ST program that can read data from the parallel
KM>port and act exactly as a printer.

I know of such programs. IIRC one of them was delivered with the ancient 1ST Word/1ST Adress office package, back in the eighties. I've been using it to copy data from my Schneider/Amstrad CPC to the Atari Mega ST back in these days, using a hand-crafted cable with crossed status lines and a special mod on the CPC to enable the use of 8 bit on the printer port.

Look for a program with the name "receive.prg", it's the stand alone receiver and will just write all incoming data to a file. 1ST Adress itself can also import data from the parallel port.

Yes, and you may use HDDriver's support for Bus Arbitration, which basically means that both the
PC and Atari may be connected as terminators on each side of the SCSI chain. Thus, you don't have
to disconnect the hard disks between each transfer as long as you don't read/write at the same time.

By the way, I have used HDDriver with an EZ220 SCSI drive and it works fine.

ISTR there was a utility called "Barrel" which was first mentioned in the Andreas Ramos "Your 2nd manual for the Atari ST". This captured printer output in a similar way to what you describe.

Impossible to say whether it would be compatible nowadays, but you can only try...

I guess you mean barrel.arc at:

http://www.umich.edu/~archive/atari/Utilities/

The readme only talks about how to capture printouts that are meant to go
out through the printer port.

What I need is a way to capture data that comes _in_ via the printer port
using a special (PARCP) cable with strobe and busy lines crossed.

Hi namesake!

I suggest you forget about UnZip and use ZIP23_02.TTP for
unzipping in Arcview as well. Not quite as handy as d&d onto
Unzip, but it works with spaces in the filenames! :-)

Regards, /Peter/

Ahh for some reason its conflicting with me IDE drive, I set it to ID1 and
my SCSI drive comes up as 0 now. I changed the SCSI Id on the drive itself
to 1 but no matter what I do it keeps comming up as 0, perhaps I can't do it
due to some silly reason. Though my Atari drive works along with me IDE
drive so its a bit odd... at least im getting there now :)

From your post it seems that you are still using an older version
of unzip and that is treating a space as the end of the filename.

Sorry - I seem to have provided wrong info earlier: Just checked
'Set paths...' in my Arcview and for 'Extract' I am actually using
UNZIP540.TTP with '%P %S' on 'Commandline'. And this works with
spaces! Try upgrading to that version.

>I am using SCSI-Tools 6.10 on the Falcon and TOS 4.02

I am using an EZ135 on my Falcon's SCSI bus and another on my son's
PC connected via an Adaptec USBXchange USB -> SCSI adaptor (if
your PC has a SCSI card, then that will not be needed), and move
files between the computers this way. The important thing is to
partition the carts PC-compatible. HDDRIVER will do this, but only
for a single partition on the drive/cart. I don't know whether
SCSI-Tools offers a similar facility. If not, change to HDDRIVER!
With that driver, it is even possible to connect both the Falcon and
PC to the same SCSI bus, so you may not need a drive as intermediate
at all!

Still not sure I understand. Can't you just run barrel on the old machine?

Hmm.

Must be a very rare Happy cartridge then for the setup to be worth that
much.

And the Happy carts do run very nicely on STE's

I actually have two different Unzip versions that both claim to be
Unzip 5.40 dated 28th November 1998

One is 175,456 bytes and the other is 116,726 bytes and both behave
the same way with the %P %S command line arguments in Arcview. I am
confused.

The smaller one is accompanied by a readme from Philipp Donze.

Regards,

Peter

SNIP

Thought i'd mention it though your mileage may vary - I use cubase audio falcon, and have a 1GB Jaz on the scsi bus being shared by the Falcon and PC. Now as long as its not the same file that you are read/writing, you can in fact read files simultaneosly by both machines, I have even tested it where I had cubase playing back several audio tracks while the PC was writing a large file at the same time, and everything checked out OK.

Heiko's Falcon Compatibility List is still posted at MyAtari.com.
Check out http://www.myatari.com/f_games.txt for ideas. Note however,
that the Falcon is not completely backwards compatible with the ST.
Having a 1 MB ST around for games is a good idea.

>>No joy there either! It displays "www-cache.freeserve.net" in the grey
>>box in the top right of the window, but nothing else goes on!
>
>Make sure that the DNS is working. You can check it with the tool DRACINFO
>after establishing the connection that there is a valid DNS-Ip. Also make
>sure to disable the STING.PRG in the AUTO folder, because it removes
>sometimes characters from the COM-Port, which result in dropping the data
>packages due to checksum errors. (This happens, even if STING is not
>active)

This is the output from DRACINFO during an online "session":
IP Address: 62.25.250.98
DNS 1: 195.92.195.94
DNS 2: 195.92.195.95
PPP
Status: Active

I removed the NameServer entries as they were not needed. I also removed
the www-cache entry as it made no difference with Adamas.

Marathon still shows "Connecting POP3 Server" I leave it for a few minutes
but nothing happens!

I have removed STING.PRG from the Auto folder, removed AUTOPARK.ACC also as
it seemed to disappear, removed Peter Rottengater's Serial CPX as Draconis
has 115,000 baud in its config section. No difference noticed in either
Marathon or Adamas.

I am wondering whether I have missed out something in the DRACCONF program?

Like what does the checkbox for "Network login" in CONNECTION-CONFIGURATION
do?

In TCP/IP Config:
What does the checkbox for "IP Address will be assigned by the provider"
do? I have left blank the "Host" and "Domain" fields too.

In RS232:
I have set the following:
Port Modem2, Baud 115200, Parity None, Bits 8, Stop bits 1.
I am using the special SCC.PRG for CT2B.

In PROTOCOL:
I set PPP
Both checkboxes are ticked for: IP Header compression & Software
compression, I have no idea what these do.

In GATEWAY:
I left 1st & 2nd DNS fields blank.
Ticked "Use default gateway"

Also I notice that some of the symbols are not in the right place when I
press down \ I get no response, I have found backslash to be on the # key -
is this a German keyboard layout? This occurs only in Draconis.

Thanks for your patience!

Neil :-)

Sounds just like what I'm searching for! Tried Google for "receive.prg"
along with various keywords to find anything usable for ST or PC. This
seems to be an unusual usage of the printer port...

Did some experiments with GFA but nothing useful. I do manage to read
some strange data from the port but nothing more.

INP(0) and BIOS(2,0) seem to behave the same. A strange thing is that as
long as the other computer interface is turned off the GFA program stops
at the INP(0) waiting for data.

When the interface powers up the same duplicate data gets read on the
Atari side like hell. Strangely the output is a duplicate of the low four
bits of the last sent byte!

When I actually print something the captured data does change but _very_
different received compared to what was sent.

As soon as I power down the transmitting parallel interface the GFA loop
stops waiting for data again. So there is some sort of "handshake" going
on.

I thought the Atari STROBE signal would be interpreted by the other
computer as BUSY but it sends data regardless of what I do on the Atari
side. Maybe the the other computer draws too much current from the Atari
STROBE?

I also tried to manipulate the Atari STROBE signal with:

```
strobe.bit%=&X10000
~XBIOS(30,strobe.bit%) !STROBE high
```

```
~XBIOS(29,NOT strobe.bit%) !STROBE low
```

Don't know if that is correct but had no effect on the data flow.

This is the little GFA test program I used:

```
CLS
strobe.bit%=&X10000
SDPOKE &H43E,TRUE !A long shot to disable any floppy activity
DO
' ~XBIOS(29,NOT strobe.bit%) !STROBE low
' ~XBIOS(30,strobe.bit%) !STROBE high
PRINT INP(0);" ";
' PRINT CHR$(BIOS(2,0)); !Read from PRN
LOOP UNTIL INKEY$=" "
SDPOKE &H43E,0
```

Maybe the solution is to hook on to the BUSY interrupt (generated by the other's strobe??) with asm code and fetch one byte at a time?

Next step will be to try this with two Atari computers as I suspect the two parallel ports may be incompatible.

Both of them (still) prints OK when connected to a printer, though :-)

Anyone with a comment?

I think I got away with just unchecking the TT-Ram(Prg) box, but the
problems seem to be with Adamas/Marathon not being able to communicate
with the driver - which seems to dial-in OK and be "active". I may try
unchecking the other one, you never know....

I got to the EasyMiNT site, I see it requires a RAW or a LNX partition.
I have 7 BGM partitions of just over 2Gb each on my Harddrive, I hope
this type would do, as F32 partitions don't seem to be recognised when I
change the settings in HDDRIVER.

Although installing MagicNet maybe the answer....

Sorry for the old post!

No response from Laurent either!
Or from Lyndon Amsdon who was supposed to be building one or two of the devices, but no sign of anything yet......?

Is anyone using one of these devices from Peter Denk? There used to be AT-Key also but that used ordinary PC Keyboards with large 5pin DIN plugs and also required you to pull the Keyboard processor from its socket in the Atari keyboard.

I would be interested to know about this device as I hoped to put something like it in to my 19" rack mounted Falcon CT60.

Thanks

2943. Questions about Falcon030

Newsgroup: comp.sys.atari.st
Date: 2003-05-25 23:09:18 UTC
From: Larry@unicode.com
Message-ID: <4bdbad34.0305251509.2354af3b@posting.google.com>
Source record: 27224
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I just received a Falcon 030 w/14Mb ram and a 12Gb hd that I bought on eBay.

I opened it up to verify the ram and hd, and discovered that it also has an add-in board with an Siemans 80286-16 CPU on it. The board says Hansi & Susi and also (c) 1993 Sack Electronic Gmbh. Does anyone know what this is and where I can get the software for it, so should I simply remove and discard it?

My other question is: How do I connect this to a TV? I am working on making an adapter for a SVGA monitor, but in the mean time I really want to test this and the video output is an RCA Phone connector. Since he Falcon has a Hi/Low channel selector, how do I connect it to the TV? (I already tried a direct video connection but that did not work.)

Thanks to everyone for the assist.

>Still not sure I understand. Can't you just run barrel on the old machine?

The way I've read it is that the OP was wanting to print from an old, non-ST machine, and capture the output on an ST. If that is the case, the only thing that I know of that will do the job is an untested app I've written. The only problem I have is I don't have a real Atari to test it upon, so while it appears to work in a controlled debugging environment, I've no idea if it will work on the real hardware.

If the OP wants to try it out, I've uploaded the program and source to my website. The archive is at:

<URL:http://www.my-ste.demon.co.uk/files/readpara.zip>

I've included a program that reads the data from buffer and writes it to a file.

There are 2 programs in the archive, READPARA.PRG and READBUFF.TTP, which make up the bits required.

READPARA.PRG sets up the buffer, enables the printer busy interrupt and points it to a reading routine and replaces the TOS Bconin and Bconstat routines to handle a buffer.

READBUFF.TTP takes a single argument, the filename for the data read from the printer port. This repeatedly calls Bconstat, to see if there's something in the buffer. If there is, it calls Bconin to read the byte from the buffer. If not, it waits for a second and repeats the check. If there's nothing to read for 30 seconds, the program closes the file and exits.

Regards,
David Bolt

That board sounds like it is a 286 PC emulator board but actually offers the hardware processor. It's useful to some but I have never found much use for them honestly.

That RCA style jack is an RF jack. You would hook that up to one of those boxes that is similar to what a Nintendo uses to hook up to the Coax jack on the back of the TV. You need one of those, most of them will work with the falcon enough to at least get some sort of picture on the screen, though you probably want to get something specific to ensure that you get a good picture.

Thanks,
Mark

If you want to connect it to the Composite inputs of a TV/Monitor simply connect pins 11 and 12 to a RCA plug. 11 goes to shielding and 12 to core. Easy to make.

I did this and was able to connect to my 27" TV.

But any TV RF box will allow you to connect to a TV as well. I had a few lying around from other Atari Computers. As a side note I tried a Nintendo one and the reception was really bad! Not sure why that was. I prefer the Composite better though.

I got mine recently off ebay as well. You paid slightly more that I did though!

Wow that is cool. I guess I need to get HDDRIVER then! I have been
stalling as I do not like mailing cash in the mail. Especially $50. Wish
someone would sell the latest version here in the USA...

^^^

I am agreeing with you there. Well it seems the Falcon030 is quite the jump
from the 520ST. Kind of reminds me of the jump from the Amiga 500 to the
Amiga 3000. Same issues, over half the games did not work. Though the
degraders were surprisingly effective in getting most games to work! They
now have HD patchers that will make most games HD installable and run on
even the fastest Amigas with 68060's which is nice...

Well I have one 1040STf, one 1040STe and a 4160STe so I am covered with that
one! LOL

Well gfa is going to hang on the inp(0) line forever until some data arrives. It's stuck in an os call waiting for a byte on that port.

You can use HDDRIVER in order to create a partition on one of these
drives that is both PC and TOS compatible. Without any additional
software, except for HDDRIVER, you can then use a cartridge for
exchanging data. See also http://www.seimet.de/hddriver_english.html

Just to clarify this: This works fine for reading data from the same
partition, but you may not write on a shared partition. This will lead
to corrupt data as both the PC and the Atari have their *independent*
caches for partition data. The PC will not notice if the Atari changes
data on a partition and vice-versa. This is an issue which cannot be
resolved by a hard disk driver.

If you have a problem of this kind that only shows up sometimes, but not always, it is hardware-related. Usually wrong termination or bad/too long cables.

I had a similar problem when working on my Falcon once. It turned out that one of the jumper wires on the DMA buffer mod had come loose.
I could hear the Falcon booting, but I had no video. Did you already check this from the previous suggestion?

The driver disk(s) (at some point I got an update from homa systems)
went to ozk along with the card. You will have to catch ozk on irc.

Ah so you missed Papyrus 9 too. :)

Yes they are expecting an Atari version of Papyrus X as well, even
though they stopped giving their development-guarantee at the previous
release. Nice to see they keep trying. :)

Since my most important workstations are a MiNT TT and an OSX Mac, I'd
love to have an office package that works on both (without emulator
stuff), and is better than m$ junk (which Papyrus is). :)

Maurits.

I see someone already posted about a program to switch it back on, but
just in case you're interested, here is the official way to fix it. :)

You can use nvconf (or something like that), which configures the
settings in the Falcon's nvram. At first sight, there doesn't appear to
be a setting for the memory test. But it's hidden in the startup-delay
setting; if the delay is lower than 8 seconds (IIRC), the memory test is
skipped.

Maurits.

>do?

Some need a standard login (not common meanwhile) procedure before starting
the ppp process.

Example:

Login: xxxx
Password: xxxx
pppd starts here.

You may do this by a script, but a simple procedure User/Password can be done
by checking this quickly.

>In TCP/IP Config:
>What does the checkbox for "IP Address will be assigned by the provider"
>do? I have left blank the "Host" and "Domain" fields too.

This is the normal way for dial in connections. Because not every user has a fix assigned IP address. You get yours (in the session above 62.25.250.98), if you dial in. On the next dialin it may be different.

>In PROTOCOL:
>I set PPP
>Both checkboxes are ticked for: IP Header compression & Software
>compression, I have no idea what these do.

(un)Compressing data, to save bandwith.

>In GATEWAY:
>I left 1st & 2nd DNS fields blank.

This means "DNS" assignment through the provider. If this is working you can check with DRACINFO. If you leave it blank, dial-in and start DRACINFO. If there are now one or two DNS-IP's it is working.

>Ticked "Use default gateway"

The normal setting.

>Also I notice that some of the symbols are not in the right place when I
>press down \ I get no response, I have found backslash to be on the # key -
>is this a German keyboard layout? This occurs only in Draconis.

It uses standard GEM-keyboard input functions. No special handling and layout are used.

2964. CT60 NEWS

Newsgroup: comp.sys.atari.st
Date: 2003-05-26 09:42:16 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ed1e189$0$23970$626a54ce@news.free.fr>
Source record: 27244

```
According to the market od the DIMMs and to the need I had to improve the
SDR controller to new performences , I decided to no more support the 32 MB
SDRAM DIMM on CT60.
Memory possible is now : 64, 128, 256 or 512 MB.
You are urged to see my new web pages to check the DIMM you can use on CT60,
and those you cannot use...

Sorry for those who already get a an old 32 MB dimm.

The new performences at 66 MHz are for page hit (8 or 16 KB) :

Read : 4-1-1-1 cycles --> 74 MB/s with nembench & kronos.
Write : 2-1-1-1 cycles --> 64 MB/s with nembench & kronos.

The controller was tested too at 72 MHz.

Regards
------------------------------------------------------------
```

En accord avec la situation du march&#65533; de la SDRAM DIMM et du fait que j'ai
eu besoin d'am&#65533;liorer les perfs du contr&#65533;leur SDR60, j'ai d&#65533;cid&#65533; de ne plus
supporter la config 32 Mo sur la CT60.
Les configs possibles sont donc 64, 128, 256 ou 512 Mo.
Vous &#65533;tes fortement invit&#65533;s &#65533; consulter les nouvelles pages de mon site pour
voir quelle barettes sont accept&#65533;es sur CT60 et lesquelles ne le sont
pas....

D&#65533;sol&#65533; pour ceux qui auraient d&#65533;ja une barette 32 Mo.

Les nouvelles performances &#65533; 66 MHz sont en page HIT (8 ou 16 Ko) :

```
Read : 4-1-1-1 cycles --> 74 Mo/s avec nembench & kronos.
Write : 2-1-1-1 cycles --> 64 Mo/s avec nembench & kronos.
```

Le contr&#65533;leur a &#65533;t&#65533; test&#65533; aussi &#65533; 72 MHz.

```

It seems like the SCSI drive wont set to ID1 no matter what I do, I've tried
4 SCSI drives now. It works happy as ID0 though my internal IDE drive wont
move from ID0 so its a bit odd..... works fine with my TUS drive, not sure
what ID that is set at tho...

How about adding in a progressbar for the format screen too ;-)

cheers,
Chris

> You need a drive as an intermediary.

Yes and no. HDDRIVER supports the SCSI driver's target interface, which means that TT and Falcon can act as SCSI processor devices and receive SCSI commands from other computers connected to the same SCSI bus. They can receive commands and send back results this way, just like a hard disk drive does. This can be used to implement a SCSI-based network, for example.

Won't move from ID0? It is not clear what you mean. SCSI and IDE IDs are
independent. I guess you have something misconfigured. Use the ID check
for getting reliable information on your drive IDs. What does the ID
check report in your case?

>
> How about adding in a progressbar for the format screen too ;-)

That's not possible as the format operation is done completely by the
drive and the drive does not report anything until it is finished. So
there is no progress information available.

It says

BUS 1 : Atari SCSI
00.00 SEAGATE ST12400N 8010 direct access
07.00 Atari Falcon HDdriver 0802 Processor
BUS2 ATARI IDE
00.00 DHAA-2540 I4I_ Direct Access

I would aimagine the SCSI drive should be 01 not 00 since the IDE drive is
set to 00 anyway.

has happened.

> Or from Lyndon Amsdon who was supposed to be building one or two of the
> devices, but no sign of anything yet......?

Ah, I forgot to say I have one working here! I am redesigning the
board that is on the Eiffel website for the additions Didier did to
the Eiffel, like two Atari joystick ports. Also the pitch of the PIC
seems to be wrong, unless Microchip made the 16F876 in 0.4" and 0.6"?

I'm still trying to contact Laurent though, as it would be good to get
my design onto the website.

As I already said the IDE and SCSI IDs are independent from each other.
So the information above is correct and makes sense. You have your SCSI
drive with ID #0 connected to the SCSI bus and your IDE drive with ID #0
connected to the IDE port. As the bus numbers (1 and 2) are different
there is no ID conflict. Each bus has its own set of IDs.
For more information on bus IDs you should refer to the SCSI driver
specification.

>Add this so it won't hang so bad.

>IF INP?(0)=TRUE !fetch a byte only if there is one waiting

Actually INP?(0) allways returned 0 regardless of any incomming data.
When you think about it this command simply can't work as there is no
input buffer whatsoever on the printer port?

So, whith the other computer turned on INP(0) fetches whatever is present
at the input data lines at the moment and returns right away.

With the other computer turned off INP(0) stops and waits for something.
If I turn it on INP(0) resumes again. Makes me wonder if it listens to
the other's STROBE or something?

Any idea what INP(6) stands for or if it exists at all?

My GFA3 manual first says the value may be between 0-5 and then list even
6 as "PRN: (printer)"!

Thank's for your efforts!

I tried these programs but the output file remains 0 bytes long :-(

First tried with the old computer and a MSTe booting from an empty
floppy. Then I soldered another cable and tested MSTe connected to a TT
with the TT sending (printing) but still got nothing.

And, both TT, MSTe and the computer I want to capture data from still
print fine when connected to a real printer, fortunately :-)

Thats what I thought, I can get the SCSI drive up though ive lost my IDE
drive, I've took out the SCSI cable and in device check it says IDE 00.00 as
I started before, though it dont come up in the format menu even. HDdriver
loads from the IDE drive though I get no partitions, im getting worried that
ive buggerd the IDE drive up cos all me stuff is on there :(

Hi.

A power supply from any Atari ST or Megafile hard drive should work.
The only difference is the bracket (holder) the power supply sits on.

If your power supply was good and had stopped working, you can usually
fix it. Look for areas where the solder has "dried up", which means
that the solder has moved away from a connection (it usually looks like
a bare wire inside a hollow hole) because of heating and cooling all
the time. Another thing to look for is a leaking capacitor, which can
be changed.

Hope this helps,

Randy Kwak

My Mega 4 power supply has long suffered from these cold solder joints. I just track them down and resolder.

You may need a good magnifying glass to find them. They are not always noticeable to the naked eye. They will look like fine cracks. If you have a good penlight such as a Maglight, shine the light across the solder joint from the edge, not straight down from above. The cracks may be easy to see and will look like a dark shadow or line in/on the solder itself.

Good luck, and happy hunting.

Ken

KM>some strange data from the port but nothing more.

What's your cable looking like? In the manual for receive.prg respectively
1st-address, there's a pinout of the appropriate cable given, which includes
some resistor (pull-up?). Can't tell the values now, as I ain't got that manual
handy here.

Thanks, I'll try the cable. Actually, I don't mind the price, as it
included Cubase Audio with manuals and dongle. The seller also threw
in a 200Mb drive that was in the system when he bought it, as he had
upgraded it to the 12Gb drive.

Hi Peter!

Mine is 116,726 bytes and announces itself in the VT52 window as:
UnZip 5.40 of 28 November 1998, by Info-ZIP. Maintained by C. Spieler.

So it seems you are using the same one as me. I am puzzled as
well! Are you extracting to a partition that has LFNs enabled? And
are you using MagiC?

As I don't have web access at present, perhaps you can mail me
your problem files/folder to xlator at cix dot co dot uk and I'll
see if I can extract them.

Regards, /Peter/

>what ID that is set at tho...

I wonder whether the connections between your ID seting switch and the
drive have come off or been connected wrongly. Or do you use jumpers
to set the ID?

The SCSI and IDE busses are independent, so you can have both set to
ID 0. Just enable them correctly in HDDRUTIL (or use auto-configure
with both connected).

Regards, /Peter/

2984. Re: Falcon030 and PC Zip/Jaz/EZ135 access?

Newsgroup: comp.sys.atari.st
Date: 2003-05-26 20:03:28 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vd4sok71ku4q18@corp.supernews.com>
Source record: 27064
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok so with HDDriver this is all that is needed for accessing a 135MB FAT partiton? (or 95MB for Zip, 1024MB JAZ)??

Or do I need BigDos or something? (Which I am unable to use as it makes my left mouse button stop working when I run it!)

This is getting to be a real pain....

Damn why is it so hard to access PC HD's on Atari when it is supposed to be native. Wasn't this hard on Amiga...

Tim

Well I tried ID0 on the drive itself and it still came up as ID0 which is a bit odd. Though I got me IDE working after hours of pulling my hair out.... Turns out the C: drive was full and It looks like HDdriver couldn't update it. I found a row of corrupt files which I hope wasn't anything important. I started to boot HDdriver from floppy and I got my IDe drive up everytime. So I deleted some files off the C: drive and reinstalled the driver and its working again now... I will try SCSI again tomorrow , time to make some backups of my C: drive me thinks also ;-)

2988. Big Partitions and LFNs?

Newsgroup: comp.sys.atari.st
Date: 2003-05-26 21:32:54 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1053981760-28461AEicMi@adel6.freeserve.co.uk>
Source record: 27067

I have been trying to activate Long Filenames on a number of hard disk partitions (7), so far without any success!

Partitions I to O are larger than 2.0Gb each, they are of type BGM in HDDRIVER and they are recognised (ie openable) in Magic v6.20/jinnee. I have put in my MAGX.INF "#[vfat] drives=ijklmno".

The type "F32" in HDDRIVER doesn't work with Magic/jinnee - the partitions "disappear" the next time I boot-up! So I set them back to BGM.

How can I check the setup and therefore that I can save a file to these partitions in Long format? I tried Texel but just 8+3 format was given to me as an option by my File Selector (BoxKite v2.31e).

The reason I am asking is that some of the ZIP files these days come in LFN format and therefore don't take kindly to being converted to SFN. I am thinking specifically of the MagxNet distribution ZIP which I un-archived onto I: only to find that the files had been shortened!! Or was it that jinnee was only showing them as being so?

The CORRECT program with Kobold2.5/3.51 reports that I: has a FAT that is too long! But doesn't fix it! What can be done?

Any help much appreciated!

Neil :-)

The cancel button does work thank goodness otherwise it would be a reset
job. When I press Cancel some error message appears saying that POP1
couldn't be connected to or somesuch statement, then another message
appears saying "No messages in Mailbox". Hmmm...I could have guessed
that! :-(

Thought I'd go the whole hog, I reduced it to 76800 and then 19200 -
absolutely no difference what so ever!!

There seems to be a communication problem between the Draconis driver and the clients (Adamas/marathon) which leaves me clueless! Does Adamas have a OVL for Internet access (like CAB.OVL)? Maybe I'm missing something or does v1.8 of Adamas work better - but that doesn't solve why Marathon doesn't connect either!

Hmm...its strange then! The ï¿½ (UKP) symbol is replaced by hash. So any emails you type are slowed down whilst you "hunt the symbol". Maybe its something to do with the other problems?!?

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 05-26-03

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM.
Unit comes with mouse, power supply, floppy drive, and manuals
all in the original boxes!
$50.00

Atari SC1224 Color Monitor.
$30.00

Atari SM124 Mono Monitor.
$30.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor
$250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$25.00

Syquest 44 Meg Cartridges. These will be Atari HDX formatted

with no bad sectors.
$10.00

Syquest EZ-135 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

Syquest EZ-230 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

SC 1224 monitor cover by Classic Covers. This is a brown cover
with the Fuji logo and underneath "Atari SC 1224 Color Monitor".
Perfect to protect your monitor from dust and have it look cool
too.
$5.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk
$5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk
$5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks.
$5.00

Decimal Dungeon by Unicorn Software. An education program for

5th graders to Junior High. Uses a variety of decimal related math problems to help you escape the evil dungeon and caves. Color or mono. Box, docs, disks.
$5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room castle in this huge adventure game. Comes on 5 floppies. Comes with box, docs, and disks $10.00

Little Computer People by Activision. There are really little people living inside your computer. And one of them is waiting for you to give him a home...and be his friend. Box, docs, disk
$5.00

Magical Math by Atari. The scholastic series math tutor program starring Bentley Bear. Box, Docs, Disk
$5.00

Mickey Mouse The Computer Game by Gremlin. Help Mickey rescue Merlin's Magic Wand in the enchanted Disney Castle.
Box, docs, disk.
$5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks.
$5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in one and two player modes. Comes with box, docs, and disks
$5.00

Plan 9 From Outer Space by Gremlin. Complete with box, docs, and disks.
$5.00

Planetarium by Atari. The scholastic series observitory in your own house. One of the better if not best scholastic programs by Atari. Comes with box, docs, and disk.
$5.00

Quartet Gold by Red Rat Software. 4 games in this box, Pengy, Cosmos, Screaming Wings, The Secret of Steel. Pengo clone, Galaxian Clone, 1942 Clone, and a graphical adventure.
Box, docs, disks.
$5.00

Renegade by Mastertronic. A Star Raiders type space shooter type game. Manual and disk.
$4.00

S.D.I. by Mindscape. Complete with box, docs, and disks.
$5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

Their Finest Hour by LucasFilm Games. The Battle of Britain
flight sim. Box, docs, and disks.
$10.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks.
$15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk
$5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$30.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk.
$3.00

Geneva by Gribnif Software. A mulitasking operating system for
the ST/TT/Falcon. Now run more than one application at a time
and have up to 256 windows open at a time. Best thing is Geneva

is very fast and stable. Box, docs, disks.
$15.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk
$5.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
This is a boxed Atari version and not the pack in with the Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

PrintMaster Plus by Unison World. The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs
$5.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk
$3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk
$5.00

STraTOS2 CD. This is a CD Magazine covering the Atari line of
computers.
It is dated 1997 and is mostly in French but many of the programs are
in English. It covers and contains software for MINT, Linux, Games
including DOOM, Internet and more. It has a program that runs the
magazine
and gets you to the software for automatic installation
$10.00

Thunder by Batteries Included. Sophisticated writing tools including
spell checker, speed-typing word expander & corrector, and statistics
on your document like the number or words, lines and more.
Manual and disk
$5.00

Time Link by Batteries Included. A time management software package.
Keep track of appointments and see them by the day, week, month,
or year. Manual and disk.
$5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair

progarms that were infected. Manual and disk
$5.00

Universal Item Selector III by AD&D Software. Full Utility functions
from your item selector. Besides adding much need funtionality to TOS's

item selector you get to see available RAM, format floppies, print
directories
set file paths, set file attributes and much more. Docs and disk
$5.00

WANTED

MagiC Mac Ver 6.XX or MagiCMac OSX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere

OTHER Platforms

I also have lists of software for other platforms like IBM DOS or
Windows,
OS/2, Mac, BeOS, NeXT, and Amiga. If interested please request a list.

2993. Just a test!!!

Hello everyone,
After quite some time, I am back online with Cable Modem and my Falcon 030. I first started out with STING which of course is not compatible with Emailer. At that point I was using MyMail 1.58 which has NO Newsgroup option. So I opted to begin setting up MagicNet with the Iconnect gateway. After several e-mails to Vassilis... (thanks Vassilis) We discussed back and forth different things to check. He looked at many of my files and found setup to be very good. It turns out that fVDI needed some tweaking in the fVDI.sys file and also reorganized my AUTO folder. Not sure which one fixed the problem but now the Iconnect gateway loads in without problems and I am able to use ALL STING and Iconnect clients at the same time!!! Definete adavantage. One probably wonders why setup MagicNet if STING was working. SPEED my friends it is all about the download speed. STING was giving me 20 to 30 K/sec average web-site downloads with spikes as high as 50 K/sec or slightly over and lows being as low as 15 K/sec. MagicNet 75 to 125 K/sec are common place with spikes as high as 125 K/sec or slightly over and lows being in the 30 K/sec range. Now with MP3 downloads. STING was giving 20 to 30 K/sec averages with highs as high as 45 to 50 K/sec and lows in the upper teens. MagicNet My lows have been 35 K/sec with averages being 45 to 65 K/sec. Highs have not gone much over 65 K/sec. Maybe close to 70 K/sec. So just setting up magicNet I would say more than doubled my cable modem connection and in some cases tripled and quadrupled my connection rate. VERY NICE work Vassilis. Just my two cents take it for what it is worth.

Thanks,
Carey

This is correct. Note that only a single partition per cartridge is
possible. This partition may be as big as supported by your version of
TOS, i.e. 1024 MB on a Falcon, 512 MB on a TT etc.

> Or do I need BigDos or something? (Which I am unable to use as it makes my
> left mouse button stop working when I run it!)

No, as I already mentioned you don't need any other software than HDDRIVER.

> Damn why is it so hard to access PC HD's on Atari when it is supposed to be
> native. Wasn't this hard on Amiga...

I don't think it is hard. You just have to use the right software :-).

I'm sorry but I am not sure what you actually want to achieve. If you
just want to change the order of drives or partitions you can refer to
the HDDRIVER manual on how to do that. Note that TOS always loads the
driver from the first bootable partition, and that it looks on IDE
drives first. This has no influence, however, on the order HDDRIVER uses
once it was started.

It definitely works with MagiC and Thing, if have used this a lot. I
also don't think this is a bug in Jinnee. There must be something else
you have missed.

As far as HDDRIVER is concerned you have to do nothing except creating a
partition with an F32 partition ID and ensure that is has been
initialized appropriately. I.e. either partition the drive with such a
partition or initialize an existing partition as explained in the
HDDRIVER manual. *Everything else* is a matter of settings not related
to HDDRIVER.

It's not. I've used HDDriver on my Falcon from day one and I never had any problems
at all with my hard disks. I shared data between my Falcon, PC and Akai sampler without
any problems at all.

If you have access to AVR or PIC micros it might be easier to listen to the Strobe and Data lines, sending the former out on a serial port when the former signals that there is new data present? You might have to develop the idea a little to perform handshaking etc of course...

Glad you've got it all working now, as you say MagxNet is faster and there is always the promise of BNet integration.

Have you tried the IConnect Telnet client Teli? It won't let me type any characters into its window here, which renders it useless.

No, nobody has ever showed any interest in using this interface. What I have done, however, is testing it by implementing a new SCSI command that a TT/Falcon can send to another TT/Falcon and that returns memory contents. The sources for this sample application are available, but one must be a SCSI expert to have any use for them.

core.
> Easy to make.

RF modulation is now obsolete since most of the devices you could wish to
connect to the Falcon have composite inputs.

I for myself cut off the power supply of the RF modulator and made a bridge
with a 82 ohms resistance from the motorola composite output to the RCA
inner connector, so that I can easily connect any TV/VCR directly to the
Falcon with their original RCA cables.

From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ed36a38$0$11674$626a54ce@news.free.fr>
Source record: 27086

OK, this morning I tried the EC on the CT60 : it runs fine like the FULL
except there is no FPU and no PMMU, this means no memory protection with
MinT and (not the least !) NO TOS copied in the SDRAM !!
This last things should be considered when choosing the 060 model !
For me the EC has no sense ; the FLASH is only acceded 2 times faster than
the TOS4 chip of the mainboard : this stills slow !

I have to inform too that because there is no software method to distinguish
between the EC and LC, a LC is not supported.
In fact it is supported and runs but it is initialized like an EC (PMMU is
set OFF) and runs like an EC !

Regards

Just tested and I when downloading with CAB download module I got 72268
Bytes/sek here on a 21 MByte file.

Manually clocked as the built in cps shows wrong results after 10 MB...

This is with a TT running Magic and the Lyndon Amsdon EtherNEC card. The
file came from a local webserver on my pc.

I'm using STinG here but I have also tested with MagicNet and the speed
was appr. the same.

Hmmm??? Strange. I have gotten the LFN to work on my 1meg Jaz
carts and all of my 250meg partitions. Have you used a setup
program for Magic? Here you tell Magic which partitions you to use
with LFN's. Until I used a setup program, I could not get any LFN
to work.

Well The origional problem was if my IDE drive came up , my SCSI drive
didn't. I couldn't get both drives to come up together. Though I lost my IDE
drive totally. I have solved this problem now since I think HDdriver tried
to update my C: drive (IDE) but the disc was full and it got corrupted. I
could boot from floppy and access my C: drive though when I tried to install
HDdriver on C: it just locked up. I deleted some files from my C: drive and
reinstalled the driver and its working again now. I can now have both SCSI
and IDE drives running :) I just hope hope those "." files with filesize
"|*\\}[-)" eventually come off my hardrive :-\ any ideas on that ?

Cheers,

Chris

Source record: 27095

Kennith,
Getting 72268 bytes/sec on CAB with STING is VERY
GOOD. But you were transferring from an internal
network computer correct?? If this is the case you
will always see better transfer speed between two
networked computers than actually surfing the web.
Anyone I have ever talked to has said that MagicNet is
much FASTER and after installing it and getting the
Iconnect gateway from Vassilis P. I believe it. I
would say my average overall on web surfing and
downloading in general is between 40 and 75 K/sec with
lows in 30 K/sec range and highs as high as 125 K/sec
or more. Sting generally averaged 25 to 30 K/sec
downloading speed with lows as low as 15 K/sec and
highs as high as 50 K/sec or so. A TT030 has more
bandwidth also so this could help you in the end
although I would expect STING not to behave a whole
different than on a Falcon030 or MagicNet should run
double what your getting with STING. Like I said
earlier though, Many people have reported 150 K/sec or
more when transferring files over internal networked
computers. Just my two cents....

Thanks,
Carey Christenson

Hi all, funny to post here again, first time in 3yrs!

Much to my surprise I've obtained a STacy 2. Though I've owned two of these beasties before (and savagely killed them, sorry) I can't remember two essential things.

1) the monitor detect pin, is it earthed to enable colour output on an external monitor?
2) the batt connections, how does that work. There are a pair of two pin connectors in the batt bay. I know the STacy is a bugger with batts anyway but I'd still like the option of 1/2 hour use away from the mains, any ideas?

Save this STacy before I start to fiddle!

Regards, Steve.

That sound like a good idea, but I don't think I want to modify mine like
that.. Want to keep it stock.

Well I DID see the price he paid, as I was looking at the auction unfold. I
paid $350 for mine, but it only had 4MB and 60MB HD. It seems that he got
the better deal, but I didn't need all the extras and this was exactly what
I was looking for. :)

A have a 512 kbit/sec ADSL here and mostly I can download with CAB as
fast as my connection permits.

Different clients will get very different speeds, though. Aftp gives
about a 10th compared to CAB in one direction, don't remember which right
now...

FTPSERV on the other hand peaked well over 1 MBit/sec when I upload from
the pc.

>highs as high as 50 K/sec or so. A TT030 has more

I guess I should try what speeds I get with the 8 MHz Stacy, but I still
have not taken the time to even install Magic on it. I guess the present
Geneva setup will make the comparison unfair.

PS. You really should add a line at the top of your signature with
nothing but "-- " in it. That would help those who respond to your posts
quite a bit :-) Note that the space after the two "-" is very important.
Check my signature for reference. DS.

I have a cd rom drive and I wish to use it on my falc. (for importing aiff's into cubase audio)

Which is the best and easiest software to use to allow me to use the drive on the falcon. I tried plugging it in and loaded up the HDdriver (7.8) software, but I wasn't able to get the CD Rom working using just this.

Thanks... Rob

It's a standard printer cable but with the STROBE and BUSY lines
exchanged at one end. Exactly like a PARCP cable.

Guess I should try with PARCP if it works to transfer files from one
Atari to another.

If PARCP and other parallel filetransfer programs works, this should also
work!

I do have basic Asm knowledge and am the proud owner both "Programming
the 68000" and a genuine GFA manual. Both in Swedish!

The Asm code I got looked promising but did not work right away. Anyway
it uses a way of solving this task that looks right on the spot.

Looks like I have to dig into some Asm programming. Haven't been into
that since Devpack 2 came out...

3023. Cubase Audio - slow running speed, any ideas

Newsgroup: comp.sys.atari.st
Date: 2003-05-27 22:09:14 UTC
From: Rob <rob19@eggconnect.net>
Message-ID: <phn7dvs1si155du17h0peqqba579440dlr@4ax.com>
Source record: 27106

I have cubase, 3 and cubase audio. Cubase 3 runs fine, but when I use cubase audio (2.6) the software shows speed problems.
I really should start using this software as I could probably achieve some things a bit easier by simply recording them, but I've been basically sticking with midi on 3.01....Anyway,

It takes twice as long to load up (though I expect it to maybe take a little longer, I probably didn't expect it to take twice as long)

When I hit the play button, the running speed doesn't run at the right speed, it appears to be 2 or 3 times slower. The falcon is set up with an analog8 and a steinberg FDI plugged in. I'm not quite sure what the idea of the FDI is, I thought it was to enable it to keep the right time so that the audio plays back right, but seeing as I'm just running the default def.arr and there is no audio with this, then I'd expect it to run on time.
When I take the FDI and analog8 out, and just plug the C.A.C in (Kindly donated by Smeg.... Thanks again Smeg), it appears to run better, though the screen update is awful.

At this point, I realise a purging of the system would help, I have got rid of all acc's, though the desktop colour and appearance is all completley different and "non standard" and so really I should put these to absolutley standard (so it doesn't use much, if any memory) - I read that one from an old SOS article).

I also use (the rather magnificent) videlity, to increase screen resolution and thinking about it, this may also be a burden on the system. (Please tell me otherwise, or if there is another way to boost the screen res right up)
I'm running NVDI, which I think should improve things, on a 14mb non accelerated, standard cased falcon)

Thanks if anyone can give me a few pointers.

(By the way, I found a text file in the PC version of cubase 3.05 saying that you could use SMP2/24 with it..... If anyone was interested.)

I was a bit reluctant to do that because the file was 3Mb. Let me know if
that is ok.

Oddly, I just downloaded a Zipped freeware game for the Palm that has spaces
in it and they opened ok. Except for one file that has an apostrophe in it.
That's a different problem.

Something else must be wrong. One cannot write on a partition if it is
full. TOS will refuse writing on it.

> could boot from floppy and access my C: drive though when I tried to install

You should check the consistency of your data. The FAT or other data
structures on your drive may be corrupted.

Not much can be done besides moving them to another partition and
deleting all files from the partition.

HDDriver doesn't drive CDs by itself. Other software is needed. My
vote for best (though to be honest, I haven't used anything else in
the last five years) is ExtendosGold/CDWriter. It costs a few bucks,
but runs very nicely. See www.anodynesoftware.com.

I believe so, though I don't remember the details. Anyhow, connecting
a color monitor disables the built-in screen and provides a nice color
output. Connecting a monochrome monitor IIRC allowed for video
mirroring.

> 2) the batt connections, how does that work. There are a pair of two pin

> anyway but I'd still like the option of 1/2 hour use away from the mains,
> any ideas?
>

Here's what I wrote in early 2002:

Don't use "C" cells! Atari tried it, and it doesn't work well (you
get 15 minutes per charge). With some expensive high-amperage cells
you can get 30 minutes, but internal packs just don't have enough
juice!

Three solutions (in order of preference):

1 -- take 3 6V sealed lead acid cells and clip them together to make
an 18V battery. At this voltage, you will use about 2 - 3 AH
(Amp-Hours) per hour, so if the batteries are all 6AH, you will get
close to three hours off of new batteries. Don't connect the
batteries permanently since you'll need to charge them with a standard
6V charger.

2 -- take a really big 12V battery. The STacy has a 'power low' light
that comes on around 11.5V. However, the STacy keeps running until
somewhere around 10.5V, so a big battery will work. (A small battery
will lose voltage too quickly, so you'll only get around half the
battery's rated AH.) I used a wheelchair battery (13.8V) to power the
STacy for over 24 hours a charge! It did weigh some 40 pounds though.

3 -- take a 'jumpstart' battery (which is really a sealed 12V) and an
inverter. This is a bit inefficient, but if I had a STacy today, this

is the way I'd probably do it so I could use the battery for things other than my STacy. In fact, I own a Mac Powerbook with a bad battery and use a 'jumpstart' battery to get many, many hours per charge for about the same cost as buying a new Powerbook battery. It's just heavier. Try http://www.store4power.com/battery-integrated-products/battery-integrated-products.asp if you need a source -- the xPower 300 would be more than enough.

Before I go on, let me note that I haven't owned a STacy in years. I once posted the exact voltage figures to this discussion, but I'm going off of memory, so don't consider the numbers in this post to be precise.

Cubase Audio should be run in mono (2 colors only). I have not tried it with Videlity. I have run it with Screenblaster II, although I
have read about others having problems with Screenblaster and Cubase Audio. My particular Falcon does not write properly to disk when
using any of the screen enhancement programs above 16 colors (this is with any software, not just Cubase). I run Cubase audio in 2 colors
with NVDI, and no other auto programs or accessories.

Rob,

A bog standard falcon will not work as bad as you describe, so there may be a problem with your machine. Try removing all accessories/auto programs and put the Falcon in a mono 80 line screen mode then run Cubase Audio. If it runs ok after that then its something you are loading. If it doesnt then maybe its your hard drive or disk driver software config. Also I'm sure that youre aware that Cubase wont record onto IDE disks, although you can happilly boot cubase off an IDE, as long as you have a SCSI drive (disk/EZ135/JAZ/ZIP etc etc) plugged in and formatted to record onto.

The FDI, other than being a digital audio interface, supplies the Falcon with the 44khz and 48khz clocks that are needed to record audio at this frequency (CD audio is 16bit, 44khz). It shouldnt make a difference to the Falcon whether the CAC or the FDI is plugged in, except the CAC only provides the 44khz clocks.

Have you ever taken the lid off the falcon, and had a look at whether anything has been installed by the previous owner? I did it to mine and found that the clockpatch had been done (Thank God!) and also there was some kind of 32mhz speeder too, which was nice :)

I use videlity too, and its works OK for me. I have it set up at 800x600 in 2 colours. I cant get a stable screen at a higher rez than this, even 800x600 with 256 colours seems impossible (probably due to the 32mhz speeder). NVDI is also running, and I recently discovered "letemfly" which makes your dialog boxes fly to the mouse and also gives them hotkeys, which you will love when you start recording audio, and do about 50 takes, cos you will only have to press one key to decide whether to keep or bin the take, instead of putting down the guitar whatever, and using the mouse every time.

If you are not using a boot manager then you should. Use xboot/superboot whatever, and make a profile just for Cubase and only load into there what acc's and auto progs you need.

Smeg.

Source record: 27118

Hi Smeg, thanks for all that, I didn't eb=ven consider switching it down to 2 colours, and will give that a try straight away. I'm glad I can still use videlity though (playing around with it last night I got a comfortable864 x 608 at 256 colours on 32mhz dot clock - it looks good)
If I use a boot manager do I goto a different setting (eg cubase boot) and load up videlity for that to set up a mono screen. In another boot setting I'd again have a different videlity setting for that ??

I have taken the lid off the top, and unfortunatley there are no liite surprises inside, I do want some sort of accelerator though, you just can't get hold of them easy these days (and not everything you wish to run always runs on them)
I do have a scsi disk for cubase (though it wasn't switched on when I did the speed check, which may be something), though when the cac was in, it did appeard to run better than with the FDI.

Anyway, I'm going back everything up, (try it in two colours) and use a boot manager to run a clean system for cubase.

I'll post back how I get on

Thanks... Rob

Puttinig it into 2 colours made a world of difference, It booted up a lot quicker. When I run Def.arr, the playback speed is correct. However I copied an audio file over to the scsi drive and loaded the audio into an audio track and played it back. It was very slow (In 15 seconds of realtime it got to just short of 5in the time line (SMPTE time line)

I'll try some of the other suggestions though.

Rob

P.S. This might sound daft, but does the FDI need to be plugged into anything to keep it's 44 or 48 khz clock (it isn't plugged into anything, I just assumed I could use it stand alone as anadvanced cac.)

If all you want from your FDI is an advanced CAC, I beg you, please sell
it to me for a cheap price ;-)

> little longer, I probably didn't expect it to take twice as long)

CAF 2.06 is a bigger program, so it makes sense that it'd take longer
to load.

> When I hit the play button, the running speed doesn't run at the right

The FDI establishes a direct digital connection to a DAT machine or CD
recorder, letting the falcon use the DAT's or CDR's A/D converters
(most likely better than the falcon's Mini plugs.) It also lets the
falcon get it's clock signal from the DAT or CDR. If you don't have a
DAT or CDR plugged into the FDI, CAF will complain about "No, or
instable Clock sigal," or somthing like that. So you must use the
C.A.C. to record untill you get a DAT or CDR.

CAF only works properly in 2 color, (black & white.)

Any screen expander will slow the system down, especially without an
accelerator.

> I'm running NVDI, which I think should improve things, on a 14mb non
> accelerated, standard cased falcon)

NVDI helps a bit.

> Thanks if anyone can give me a few pointers.

To use the FDI, get a DAT or CDR, run in 2 colors, don't use Videlity.
(I like videlity, but it's gonna slow things up a bit. Get an
accelerator! :-)

Is someone looking for an FDI?

Aw shucks, there's that word 'cheap' again.

3045. How to get .st (.msa)-images on real Atari disks on new PCs?

Newsgroup: comp.sys.atari.st
Date: 2003-05-28 19:07:19 UTC
From: Uri Puivov <u_ri_p_ui@yahoo.de>
Message-ID: <bb31dv$50qgo$1@ID-130827.news.dfncis.de>
Source record: 27127

Hello,

I recently bought an Atari 1040/STFM. And I've downloaded many disk
images of games. It's nice to play all these great games on an emu-
lator but a real Atari gaming would be a more enjoyment.

Unfortunately, I've got a rather new PC with an Elitegroup K7VTA3.0
mainboard with VIA VT8233A-Controller. And it semms that I can't
write the extended disk formats using this configuration (800kB,
820kB and so on). I've tried booting from a DOS6.22-, a W95B and
a WME-bootdisk and using makedisk, stdisk and wdfcopy (all newest
versions) without success.

Following things occured:
----
under _stdisk_: using a 720kB-medium (that one with one hole), it
says under DOS: 'address mark not found' when it
wants to format the first sector, first track and
first head. Using a 1.44MB-medium, it works fine on
my PC, but it cannot be read by my Atari.

under _wfdcopy_: it works good until it reaches tracks above 73.
All these tracks above are marked red instead of
green. And it only runs until track 80 although
the image has got 82 tracks. Disk is not readable
by the Atari either.

makedisk doesn't work at all.

So, because writing real Atari disks out off images on my PC doesn't
work, I've two possibilities:
----
1) Using a parallel-(serial-)cable to connect my PC to my Atari and
transfer files to disks

2) Using standard 720kB-disks between my PC and my ATARI

Now my questions:

1a) If I use the cable-connection between my two machines, I can trans-
fer files to an inserted disk in my Atari, right? What's about disk-
images (.st, .msa)? Is there a program to read these images and di-
rectly write them through the cable on disks inserted in my Atari?

2a) If I use disks for swapping files between my two machines, please
imagine following: I've downloaded FuzionCD100 (fuzcd100.msa). Now,
I love the games on there, so I want to play them on my real Atari

to get the right feeling [;-))]. The file itself is 821kB big and
it's in .msa-Format. So I use 'msatost' to convert them into a
'.st'-file. This file (fuzcd100.st) is bow 820kB big. It's too big
to put it on one 720kB-disk, so I use a splitter on my PC to split
it into two smaller files. I copy these two files on two 720kB-disks.
b) Now, how can I join them on my real Atari? Has it got something
like a ramdisk?
c) If I've successfully joined them on my Atari, how can I write them
to a real Atari disk on my Atari?
d) Or is there a programm that can built a disk out off two splitted
parts of an image on my Atari?
On my (now damaged and now more loved) Amiga I compressed the .adf-
images with 'lzh', decompressed it into the ramdisk on my Amiga and
used 'adf2disk' to get a real Amiga disk out of it. Is there an equal
way for the Atari? I can probably use it with the cable connection,
too?

Sorry for this very large posting, but I've searched very much and found
nothing.

My PC sytem:

Elitegroup K7VTA Rev. 3.0
AMD Athlon XP 1600+
512MB Ram
80GB Harddisk
Radeon 9700Pro
WinXP

My Atari:

Atari 1040/STFM

Many thanks in advance and kind regards (let the Atari live again),
Uri

have you formated these on your atari to the required tracks/sectors??

if not use something like format 3. is it?? been so long since i used it :)
or is it fdisk3?? not sure but someone will tell you :)

good luck

3048. DSP port on the Falcon

Newsgroup: comp.sys.atari.st
Date: 2003-05-28 19:24:23 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <1054131604-20503AEicMi@adelphia.net>
Source record: 27130

Everyone,
I am sure this has been asked a million times but I
have yet to have seen this mentioned in CSAST. But
what is the DSP port on the back of the Falcon used
for??? Makes me very curious and want to tackle
another MOD on my Falcon as soon as I have the CT60
installed.

Thanks for the help,
Carey Christenson

III
III "The High Flying Atari Falcon 030
/I\ Soon to be CT60
/ I \

Atari Falcon 030 running at 16 mhz. DSP running at 32 mhz. 14 megs of RAM
Coming CT60 with a 68060 running at 72 mhz. 256 megs of PC133 SDRam
Eclipse with 4 meg ATI Graphic Card
Coming 64 megs of DDR SDRam GC by NATURE for the CT60
Coming Deesse sound card with 100mhz. 56301 DSP processor running up to 6 times faster than the stock DSP

You could get round the falling-voltage problem by building a 12V switching-regulator. If you can manage that, then in theory it will keep on outputting 12V regardless of battery terminal voltage, right down till the thing's completely spent. You'll probably need a fairly high-power regulator chip, with external power-transistors, though. One chip I'm planning to use for an almost identical purpose (driving an AT motherboard from a lead-acid battery on a hobby-built robot) is the National Semiconductor LM723.

Thanks all who replied on and off list, if only to remind me of past crimes.
The one bit of info I can't get is to polarity of the battery conecters, ie which is +ve and -ve in the batt bay. I'll give it a month or so then experiment, so look forward to those STacy parts around July :)
Interesting to note my 4yr old has inherited the Stacy destruction gene, throwing it across the room a few days ago. No real harm done though, tough old things, maybe thats why I like the challenge.

Regards, Steve.

3052. Re: How to get .st (.msa)-images on real Atari disks on new PCs?

Good idea. I've done that. The program for the Atari is called 'format3.lzh'.
So, I've formatted the disk 82 tracks / 10 sectors on my Atari and used
'wfdcopy'. Writing was very slow (apr. 5 minutes or so). I've got the same
red sectors after track 73.

I've inserted the disk into my Atari and looked at the directory contents.
It showed me the files. But after I used 'info' on the floppy drive icon
I've got two bombs on my screen. Booting from disk hasn't work, too. The
Atari showed me the boot screen and then switched to GEM with no icons
at all. Perhaps I'll give stdisk a try...

Many thanks for your response, got a step further,
Uri

3053. D-NARM

Newsgroup: comp.sys.atari.st

3054. Re: Parallel port reading

Newsgroup: comp.sys.atari.st
Date: 2003-05-28 20:55:00 UTC
From: Ekkehard_Flessa@wun.maus.de
Message-ID: <200305282255.a42248@wun.maus.de>
Source record: 27024

Hallo Kenneth!

KM>It's a standard printer cable but with the STROBE and BUSY lines
KM>exchanged at one end. Exactly like a PARCP cable.

Thanks to the upcoming long weekend, I've gained access to the manual again :-)
The cable in there is made up as follows:

Printer (sender) Atari (receiver)
36-pin centronics 25-pin sub-d
Pin number, name Pin number, name
1 _STROBE_ --------- 11 BUSY
2 Data 0 ----------- 2 Data 0
3 Data 1 ----------- 3 Data 0
4 Data 2 ----------- 4 Data 0
5 Data 3 ----------- 5 Data 0
6 Data 4 ----------- 6 Data 0
7 Data 5 ----------- 7 Data 0
8 Data 6 ----------- 8 Data 0
9 Data 7 ----------- 9 Data 0
10 _ACKNLG_ --------- 1 STROBE
11 BUSY --R=1.2kOhm-- 22 GND
12-15 NC
16 GND -------------- 22 GND
17 NC
18 NC
19-30 GND ----------- 22 GND
31-36 NC

(All GND tied together)

So, strobe of the sender goes to busy on the receiver, but strobe on the
receiver is linked to acknowledge on the sender and the sender's busy line is
just connected to GND with a pull-down-resistor.

The manual states that it's not possible to use an Atari as both sender and
receiver.

Most people fit external DSP clock there, so they can replay/record 44kHz and 48kHz samples without interpolation.

It may be used for many more things for sure.

I think its TOS 4.04, ive had problems like this before when the disc is
full. its done it in a few programs that it tries to save, says disc is full
then creates a corrupt file. probably some odd bug somewhere in TOS.

I know on my PC (KT3 Ultra w/AMD 2200+) I have go boot to a DOS Disk and I use STDISK.

I have to write a 720k ST image FIRST, before it will work (for up to 830k images!, nothing higher!) But it does work. I used DSDD 720k disks and it works fine.

Semper,
What adavantage would plugging a DSP clock give a
person?? Does it improve the performance of the
computer by very much?? I also wonder what else can
be done with the DSP port?? Anyone else have
information??

Thanks semper,
Carey Christenson

I know I'm going to regret this but...
I've read this bizarre vendetta for months and I honestly can't see the reason for it. What *is* this po-faced attitude and how did it get this abusive? It can't be bandwidth, because there are sigs and overquoting here that beat any (every) ads, let alone the intensely boring bandwidth wasted in endless to-ing and fro-ing between childish simpletons.

What *is* this ethic that's being defended anyway? Yes, I do know the rules, but the question's the same - if there were a hundred different vendors posting weekly there'd be a problem but there ain't, so it isn't - no contest.

If there _were_ a hundred Atari vendors posting their adverts each week I wouldn't be typing this on a PC today - that's the truth!

If someone's been hard done by, why do the rest of us have to be punished by this endless repetition. If the guy's really gay, there's no law against it. If he's a paedophile, call the police. If he's neither, shut the f*ck up in here and take it to mail!

And don't reply in here - take that to mail too. The thread of complaints is off-topic here - at best it's an admin issue.

Without external clock DSP plays/records samples at a bit strange freqencies. They are close to commonly used, but not enough. Then to save them as (or play such sample) it must be interpolated to correct freqency and it decreses its quality. And for example, such interpolation costs CPU/DSP time and it may be important for realtime apps.

For other uses... I do not know, it is an most obvious use...

hello Jos/Luposian

I seem to remember the very same person (this so called top atari manager) in a previous interview with Atari Games H/Q, when he claimed or was quoted as saying that "we (atari) do not intend making the same mistake as the previous administration" noticed that he stated the word administration (singular) which in that case refers to Hasbro, which was the management responsible for the change in Atari's business model, i.e changing atari from a manufacturer of hardware, to little more then a publisher/manuf. of software

I happen to know some people that were involved in the sale of hasbro's atari assets, the people concerned managed to get their hands on the rights/patents (cant remember which- this was nearly 3 years ago)to the home games versions of pacman

They told me that the reason why hasbro sold atari was simply because, and this is in the words of the hasbro rep.., Atari wouldn't or wont ammount to much as a software company as much of the patents and rights in the main, relate to hardware technology... Additionally according to these guy's involved in the sale of hasbro's atari, the core reason for hasbro selling atari in the first place was because, Atari was loosing money hand over fist on the software side of the business (bearing in mind that Atari had changed business models from hardware to now software manuf./production)

Additionally, the same bloke was also quoted in the same interview as saying that "I have been an atari fan for many years"

Very interesting, if this is the case, and if his knowledge of atari's history is as good as mine or better, what does the labels ATARISOFT and ATARI INTERACTIVE mean to him, my only memory of these labels were, that they eventually led Atari to being sold off and the software companies/labels scraped

After all I didnt hear much of atari soft 12 months into tramiels admin., I didn't see much impetus on JTS or Hasbro in resurecting atari interactive once they'd acquired atari

Now coming for someone with no business experience in the computer/videogame industry (namely myself) I would bet that I would make more money and profit in resurecting atari as a hardware company, then the current bod's presently screwing up atari left right and centre, would be making as a software company

After, if atari was ever supposed to be successful as a software company, then why was it that tramiel scraped atarisoft within 6

months of taking over, and that JTS/Hasbro saw Atari interactive as a dead issue, in addition If the current bod's at atari are that successful at software publishing why is it that companies like eidos and electronic arts are making significantly more profits and therefore more successful then atari are (as a software company), after all lest we forget Atari virtually created the concept of 3rd party games publishing, after it allowed activision to produced vcs software for the vcs systems back in the early 80's) and ofcourse Atari is slightly a better known name in the videogames world, then the others mentioned.. how about explaining this one to me infogrammes.....

Hi Mark,

> Hi Lyndon, built my programmer, and got 5 pics through microchip for work
> evaluation ;-) Will set it up soon.

Yes, the JDM should work fine, it's what I've been using for the last
few months. Make sure you didn't get the 16F876A, on Reva they changed
from EEPROM to Flash which requires a different way of programming.
I'm not sure on the details, but it's in the PDF paper about migrating
from 16F87x to 16F87xA. Basically the freeware programmers on the net
don't support the RevA chips. Certainly not the JDM anyway, I made
that mistake some time ago!

I have put up a little bit here http://hardware.atari.org/eiffel/

Package includes a little text and the Scooter PCB layout. I need to
finnish the layout though, with support for a NTC sensor. (temperature
sensor, Didiers CT60 accesory supports this).

I would still like to get in touch with Laurent though!

Thanks, Lyndon

I have a Steinberg FDI (Falcon Digital Interface) connected to the DSP port. This gives optical and coaxial digital in- and outputs that I can connect directly to a DAT, MD, or DCC recorder. Great for CAF and Soundpool Audiomaster software.

I also have a "Jam OUT 8" box that can be connected to the DSP port (Soundpool has a similar box). It is an 8 channel D/A convertor with 8 separate outputs. This gives a much better audio output from the Falcon than the built in D/A convertor that leads to the mini-jack on the back of the Falcon.

Yeehaaa! It works on my PC, too. A little bit fuzzy but at least I can make disks. There are only 6 FuzionCDs with more than 830kB: 3x 880kB, 2x 891kB and 1x 902kB. No idea how to get them on disks, but never mind. Thanks alot, Tim. I think that this little trick should get into the FAQ...

Cheers,
Uri

Slight correction, the external clock plugs into the DSP port, yes. But it doesnt supply a clock to the DSP, but to the Codec chip. The clock is divided to give the correct frequency, IE a 22.5792 Mhz crystal will give you the required 44 Khz sample clock, and a 24.576 Mhz one will give you 48Khz (Used for DAT).

I use the Soundpool version of the FDI (well they are all made by soundpool)
buts its labelled an SP/DIF and its a much nicer green colour :-) and the
soundpool labelled version of the FA-8 (8 analog outputs similar to the JAM
8) is called an Analog 8.

To Carey:

Because the DSP port is actually tied to the DSP chip (apart from other
things), there are quite a few possibilities for this port, though nothing
much was ever made other than studio hardware because I guess there wasnt
much of a market at the crucial time.
I think the most important one is the fact that there is a super fast serial
capability on the DSP chip, and the serial connections come out to the DSP
port. This could be used for a USB or an Ethernet device if anyone wants to
design one.

The best formatter/copier on the ST is Fastcopy Pro by Bartin Bakschat
(sp?). Fastcopy 3 is good but doesnt do 1.4Mb disks.

The one to use on the PC is VGACOPY version 625 or above. Run it in pure DOS
if you can. It writes directly to the floppy disk driver chip, and even
better it looks like Fastcopy.

Try them both, you wont regret it.

Smeg.

Well, the most important use for me is to plug into external recording
devices, ei., FDI, FAD 8. This allows for professional quality
recording. Other than that, the dsp "chip" is used with software that
is written for it, ei., aniplayer, but the port is for recording with
another device

I gave my CAC to Rob, then using the SPDIF/FDI with an ANALOG 8 that I got
from him the same day, I played back some stuff I had previously recorded
using the CAC and it played back fine, whether I had the Analog 8 attached
or not. I have since opened my SPDIF and confirmed that it does indeed have
the 22 and 24Mhz crystals required for 44 and 48Khz sample clocks. I have
never got a bad clock message from Cubase, so i'd be interested to know
where you got this information? Maybe it was the older versions of SPDIF/FDI
that didnt have the built in clocks?

>
> CAF only works properly in 2 color, (black & white.)

It works in any legal mode, but its bloody slow.

Hi Smeg, out of curiosity, I took mine apart too, and I think I have both the crystals. (I have a serviced by atari workshop sticker on the bottom, so I 'd say it was a cert.... anyway, small silver thing with 22 printed on top, and slighty bigger one next to it with 24 on that)... not that it makes much difference, I don't have a DAT anyway....

Reading your last post, I get the impression you're knocking the "need a DAT" quote into touch as, seeing you dion't have one yourself, but you got it playing ok.. (that right ??) I was thinking that because I ddin't have a DAT then that might be causing part of the problem, but then again, after youre post, maybe not.

I'm gonna bare bones everything tonight, just install NVDI, then cubase in 2 colours and see what happens. (I'll try adding videlity after that (I managed to get a cool 900 x 600 in mono, very stable too)..

Uptil now the 2 colours has speeded up the running, but just playing back a 1 channel midi file in audio runs slow, so something is obviously wrong.

If this works, then I'll install superboot and proceed from there, if I can just get it running write, I'll be happy.

Source record: 27166

I've managed to get it working.

Haven't done anything else, other than plug the FDI into my PC.

Let me explain, I had a thought that maybe I was set to 48khz and something was running wrong seeing as the samples were 44khz. While I was in the audio hardware window, I clicked off A/D Left to FDI and it was telling me there was no signal.

I switched my music PC on, it has a gullimot ISIS sound card with breakout box, on the front of which is a coaxial digi in and out. Connected this to the SPDif in and out, set the output in the ISIS to SPDif, and it automatically set the resolution to 48khz

Went back to the audio hardware in CAF and it told me that the clock was now 48khz.. HAving not had this before, I hit the play button, and it played back in time.

So I loaded up a single midi channel, and dropped in some audio on two channels, hit the play button and it worked.

Only thing I did notice, was that after a couple of minutes, the moniter screen flicked to a "mono with a hint of red about it" sort of look. Never done it before. I exited out of cubase, went back to the desktop and it went back to it's proper black and white.

(this may be down to the 48khz clock, or it could be videlity - I'll still bare bones everything tonight and take another look)

SMEG, does it work ok with your mini disk player, does that give you the correct sort of clock.

Thanks to everyone who gave me pointers... Rob

I think you didn't configure the right frequency in CAF. Standard it's 33 KHz or something, so I think that explains why your 44/48 KHz tracks ran too slow.

You can configure the KHZ somewhere in the audio menu.

Hi all ,
I bought 2 weeks ago a Atari 1040ST with a Unitor.
Now, i'm looking a good music program to make work this little thing.
I tried Cubase lite but too light. Not enough editing menu.
I also tried Notator but too complexe when you don't be the Conceptor
of Notator.
Does any know a easy to use and advanced stuff for creating Music?

Any proposition welcome:)
Thanks for your answers.

PS: I'm ready to invest.

It was on 44khz on A/D left.

When I had the CAC in it, it didn't run right, when I had the SPDif in
it it didn't run right, not until I plugged in the SPDIG in the PC's
ISIS anyway.

(I will actually try it again with the CAC and report back my
findings.

Well you could try Cubase full version 3.01, there's plenty of editing
menu's in that.
You can use the unitor with it, but I'm not sure what you use it for
(wethere it's just the syncing, or if you can use the midi ports too)

Other than cubase and notator (or creator), there's not much else (if
anything) that you can use the unitor for)..

> if you can. It writes directly to the floppy disk driver chip, and even
> better it looks like Fastcopy.

Ok, I've downloaded VGACOPY 6.25 and booted from Win95B-Bootdisk. Then
I've renamed 'fuzcd100.st' to 'test.vcp' and run VGACOPY. I loaded
'test.vcp' and pressed 'w' for writing this on disk. All I get are
yellow sectors. I've turned off modify with no success. Then I've
turned off verify what makes writing ok. But my Atari doesn't recognize
the disk. I've rebooted WinXP and run VGACOPY under that. Writing the
same image seems to work until track 79, then I've gotten errors and
errors. I've read the faulty disk again and saved it to 'testread.vcp'.
Then I've made a filecompare where the two images are the same until
offset 1200. *sniff*

Any ideas?

Thanks for that nice hint, perhaps the way to do it?

Cheers,
Uri

At one point, when the Falcon first came out, I remember reading about the
possibility of connecting some sort of digital modem to the DSP port, but I
never heard anything more about that afterwards. Ethernet might be a good
modern equivalent, if someone would ever want to build one. Although, just
like the ROM port devices being made, this assumes you don't already use it
for something else, or don't mind swapping devices back and forth on the
port.

Hm. The manual says that it won't work "properly" in anything more
than 2 colors. I know that CAF will play songs back ok at 256, I think
it won't record properly though. To be honest, I've never tried
recording many tracks at higher colors.

Yup! IMHO, a Nemisis makes the Falcon less painful to use. The CT2B is
a dramatic difference, quite tricky to install (I eventially sent my
MB to Rudolphe for a proper install. Works perfectly ever since!)

Waiting for my CT60! Probably can't get one, unless Rudolphe get
another 100 orders?

Well, then Steve, why pray tell, are you advertising for AVG and
grisoft??

I have been reading this group since the mid 90's, and have always
seen Ben's ads. I don't hear you speaking up against the person
posting the filth, since this isn't the place for that either.

Bottom line, apply a filter to Ben's posts, and move on with life.
There's so much traffic in here anyway, I am sure that just reading
all the off topic/spam takes up most of a day.

Besides, we evidently disagree, since our beloved atari 8bits have
been out of production for coming up on 20 years, and the fact that
this group is so limited, I think advertising wares is just fine.
There's so few people left with wares, and I am sure even fewer
willing to pay for said wares. Besides, who made the people demading
no ads, the owners of this newsgroup?? You want to filter people set
up a web discussion board, and filter away.

Isaac

3097. Language disk

Newsgroup: comp.sys.atari.st

well its supposed to drive an IDE hd using an ordinary Atari ST. But that is my derivation of it. follow the links at the bottom of the page if you are interested in building one because those ppl have theirs working but i broke the /DTACK pin off my CPU. I could drill through the sink on the chip as some have sugessted to try and solder onto it. But that ST has gone back in the cupboard it came from for the time being.

what do you mean 'language disk'? do you mean the one that came in the
bundle with the ST? because i'm staring at a disk labelled

Language Disk
First Basic

if thats what you mean?

Everyone,
Thanks for the information!!! I really appreciate
all the information. Just a few questions. I would
like to get one of these DSP clocks anyone know where
they are available at?? And Martin, about recording
to Digital devices... is it possible to convert MP3's
to WAVE files with ANIPLAYER then copy them to a tape
recording device with that device you have??

Thanks all,
Carey Christenson

3102. Printing problem

Newsgroup: comp.sys.atari.st
Date: 2003-05-29 20:48:44 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <bb5rnc$t83$1@thorium.cix.co.uk>
Source record: 27182

I thought this might be of interest to others who may encounter a similar problem.

A couple of days ago I found that I couldn't print from Papyrus 8. Attempting to do so gave an alert that the 'GDOS driver #21 could not be found, or short of memory' (but showed over 8 Mb available!). Attempting to prin to an IMG file also gave 'Driver #91 not found', although I could 'print' to a GEM vector image file. However, attemting to print these from ArtWorx failed too, and Atari Works also couldn't find GDOS driver #21. OTOH IdeaList printed files correctly, using GDOS fonts via NVDI, and That's Write - which has its own SpeedoGDOS replacement built in and doesn't use NVDI - also worked fine.

Papyrus and Works had been OK earlier. I tried checking NVDI.INF and ASSIGN.SYS, but all seemed OK.

Eventually I found the problem: Earlier I had selected 'Background printing' in the NVDI 'Print' dialog. When I changed it to 'Foreground', all was well again! But I am stumped why the programs couldn't find the GDOS driver when set to background printing.

So if you encounter programs that refuse to print with NVDI, check the 'Ports' setting of the NVDI 'Print' dialog, either in the program itself or with PRINTER.CPX!

Regards, /Peter/

Good move. Is it an STF, STFM or STE?

> Does anyone know a easy to use and advanced stuff for creating Music?

Cubase v3 is the industry standard.

Which Unitor do you have, 'N', 'C' or '2'?

Unitor '2' will work with Cubase, the dongle will fit in it.

Unitor 'N' and 'C' have no dongle port. If you want to use (the best) Cubase
sell the Unitor on to fund the purchase of Cubase.

Cubase is available from Keychange Music, (me). www.keychange.co.uk

Full package is £99, dongle and discs only is £65.

I may do a deal on the Unitor if it's an 'N' or 'C'

> PS: I'm ready to invest.

Good.

Barrie, you say the dongle will fit into the unitor 2, do you have to
cut the ends of it down, as mine is clearly too big, and won't fit in,
unless I modify it's case.

I've found that Cubase cannot import aiff files directly from a CD.
You have to copy them to your hard drive first. Midi files are OK
though.

If anyone, and I mean ANYONE, wants to make me believe this is actually going to work, they will first have to put THEIR money where their mouth is! Send ME even $1 (even via PayPal! Hey, now there's a thought! A new way of sending and recieving scam money!) and I'll *think* about doing this.

But I am sure, along with those Nigerian "twenty-three million dollars" offers and the tons of "Microsoft Security Patch Update" Emails I get, this is no different...

And the non-US addresses don't make me feel like shelling out postage for this offer much more either.

My wife tried it... nothing happened. I've *never* tried it... nothing happened. Gee, same difference!

You may want to ask to Jan Krupka
http://jaysoft.atari.org

He is going to built a few ones for people interested. Price should be
under 15 EUR / 10 ï¿œ if there are enough people.

Bye,
/Pascal/

PS: Please, save the bandwidth! Make your sig shorter. You can also add
a sig separator as you were already advised. Thanx in advance :-)

How is the Power connector handled on the original case? any ideas on how
to add a PS w/o it looking like a hack?

I am a dumb Amiga user that was spoiled with such an easy to use and great working OS... LOL

NOW... I want to use MiNT on my new toy: An Atari Falcon030 ;)

Any guides or sites on how to install a nice setup of MINT?

Thanks!
Tim

True. The point is that the battery compartment is worthless (well, I
used it to carry a spare power cord). Plug into the external power
port. In fact, I had one internal battery where I had to make a small
slit in the case to run a line out to the external power port.

Hi all
Trackman is on my site with a good selection of Atari-MIDI sequencers.
The "bread and butter" section I call it. See my main page.

http://tamw.atari-users.net/timidi.htm

We have several alternitives to Cubase, although I don't know if the
unitor unit will work on everything.

I also recommend Master Tracks Pro,(the HTML manual is now available
as well) or even Dr T's KCS (Keyboard Controlled Sequencer)although
people say there is a big learning curve on that, but it has LOTS of
editing functions including PVG (Programmable Variation Generator)

I also recommend trying out some of the more adventerous apps on my
site which are of the algorithmic nature. For a good starting point on
these, download the Atari-MIDI toolbox now at http://www.myatari.net
on my monthly article.

have fun!

A think you misunderstand, or I misunderstood your original
question/problem.

The .ST file is basically a raw disk image. So is the VCP file - except -
there is a header on the file which has a description of the disk. You cant
write an .ST file using Vgacopy.

You can use VGACOPY to format floppies on the PC that you want to be bigger
than normal (IE 82 tracks 20sectors) for .ST files that need that format
disk. If you press formfill button you you can choose a type of format
using the mouse in the bottom window. It will load that format into the disk
buffer then you would use the Write button to format the disk. You can press
a function key instead for the most common formats (F8 is 10S 82T, F10 is
18S and 80T (standard 1.44mb)).

Once you have formatted the disk with Vgacopy, and you dont get any dodgy
sectors you know the disk is ok, you could try makedisk/STdisk again. If you
still cant get it to work then its probably your floppy drive is only just
aligned so writing extended formats increases the error in the alignment,
also disks transfered from one machine to another will have problems. I had
to change the floppy drive in my PC last year because of this.

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka306.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

With this update there is usual corrections. There's also
new image formulas.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12

> the correct sort of clock.

Rob,

I dont have a minidisk recorder yet. Still havent decided whether to get a portable MD or a standalone DAT player. Will probably be the MD.

However, I dont have any digital source connected to my SPDIF. I just record with A/D input (Which I converted to Line levels along with the headphone socket), and the clock in the window I set to 44khz. Cubase doesnt really know that an FDI is there at this point it just sees a 44khz clock available

coming from the DSP port.

Something is wrong here, because you should be able to get that clock without having a source plugged into the FDI. Maybe you have an older FDI (that has been upgraded by Atari Wripshop to 24bit). The serial number on my SPDIF is 24737. I guess the first part "24" means its 24bit version as I dont think they made 24000 + of these things....

When you opened your SPDIF did you see 2 metal cans inside, sticking up from the PCB in the corner? These are the 22.579 Mhz and 22.572 Mhz crystals for the clocks.

Smeg.

This is because Cubase needs the samples to be on a SCSI hard drive.

Hi Smeg

I remember having a similar problem using the one you now have, I'm not trying to record anything, just play back some loops, but even without any audio in, If I just play back midi, it runs slow unless I plug it into my ISIS soundcard on the PC. It's still doing it with just the C.A.C plugged in too, I need the FDI plugged in to get it playing right.

I took the FDI apart, and it does have both crystals in it (22mhz is smaller than the 24mhz one, both silver in colour)

By the way, would getting a CT60 (your next post) mean that it'll just run a darn sight easier, and I'm guessing the falcon would need re-casing... (would a rackmount do it, or would it have to be PC type case

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!
http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at

Right, then its either a problem with the Falc, or configuration within
Cubase.

> not trying to record anything, just play back some loops, but even
> without any audio in, If I just play back midi, it runs slow unless I

It does this with a just a MIDI file, IE-no audio on the tracks?
How about an older non-audio version of cubase like V3?

> plug it into my ISIS soundcard on the PC. It's still doing it with

I guess so. Someone said that Cubase runs on the CT60 so it would be a lot
faster.
As for recasing, someone else will have to answer that, as I dont know,
though I am sure another PSU will be needed.

Smeg.

Non audio version 3.01 runs absolutley fine. Me is thinking that me
does'nt have it set up quite right.

I'll have another look around... (though I'm not entirely sure what it
is I'm looking for)

I've just been trawling the previous postings of this news group
looking for info... The CT60 is just an accelerator with extra memory,
yes? And it would benefit from being assisted in duties with a
superior graphics card (not necessary, but it would be better...
something like a nova?? Not that you're likely to get one these
days)

Ok ;-), now I've understood. Unfortunately, this doesn't work for me as
VGACOPY neither formats 720kB not 820kB under pure DOS. I've found an
old 2.88MB-floppy and installed this into my PC. Now STDISK works very
well under pure DOS but only for disk images with max. 830kB. Don't know
why. Perhaps I'm going to get an old PC, install Win95 on it and try
WFDCOPY as it says in its readme that under Win2K (WinXP) it doesn't
work with more sectors than 8 and more than 80 tracks...

Cheers,
Uri

(Um... nice insult, moron. You do a great job at projecting your own issues onto everyone else, don't you?)

> We will discontinue our postings at the exact same time that Benny Boy
> discontinues his spam. He stops, we stop. He continues, we continue.

Ok. Then answer this to my satisfaction: Why? I don't want to read to your idiotic, profane stupidity anymore than you want to read Ben's ads, so you are being just as bad (well, worse, actually). Besides, he's probably not even reading these, as he's said that he ignores these posts. So all you're doing is annoying everyone else *but* the one you are pissed at. You are managing to screw up everyone else's enjoyment of this group, while *not* getting your point across to the person you are directing it to. So stop this stupid, cowardly stunt now and grow up.

> We go through *several* remailers in
> *several* countries and everything is encrypted from the source right to
> the last remailer so, good luck buddy.

You wouldn't go through all this trouble if you weren't doing something you knew was stupid and wrong, so why bother? Why not do the honorable thing and discuss this one-on-one with Ben instead of taking your ignorant vendetta out on the innocent readers of this group?

> The best method to have all of these discussions discontinued is to
> ensure Benny Boy doesn't spam any further and then, problem solved.

Is that *our* problem? NO! Go straight to him via e-mail, where you can actually reach the guy, and leave this group to what it was meant for. You do realize that his e-mail is easy to get ahold of, as he doesn't hide behind remailers like a coward...

> Why does Ben get all the fun? He's not only a spammer but a scammer.
> He's ripped-off people in our group before any of this even started and
> now he chooses to spam so no, we aren't going anywhere yet.

I haven't heard of anyone being ripped off. In fact, the only comments about his service is that it is exemplary.

> [A.L.F] .,~Atari Liberation Front~,. [A.L.F]

And what the **** is this?!?!? You really do have an overblown ego and a demented desire to tarnish the Atari name, don't you? Grow up and get a life.

My final statement on this: This crap won't get through to Ben, so give it up and let us get on with actual productive discussion rather than your stupidity.

Isaac,

My position and the position most complainants have and don't even know it is not that Advertisements are unwelcome here, it's that BEN's advertisements are unwelcome. Why? Ben is ignorant of his own customers, he doesn't listen to what people say. He posts the same damn drivel over and over again. For example his free stuff list. We've already established that it's a bunch of crap that no one wants to drive to portland for. Post it once, post it twice.. give up and ship it or toss it. Ben is an ANNOYANCE. He has no products that I would actually want to buy. I'm a scavenger.. I like to find the best deals, it's in my very nature to avoid stores like that. Probably most atarians are similar. Combined with a rather stunning reputation of atari (16/32, can't vouch for 8bit), sellers on ebay, I don't have a reason to ever turn to ben. plus I know mouse_master who bought out toad computers and has boxes and boxes of replacement IC's and such. I know Stimpy who has some replacement parts I could buy.... you know it's just pointless. You can pick up most any 8bit machine off ebay and most of the mods are DIY. So who cares?

The problem that people have with ben is that they never see anything new, fresh, exciting or different. The ads are the same, formatted the same,

filled with exclamation points and whiz bam deals and 20% and 30% and it just sounds rediculous. He sounds like a #$#%@! vacuum cleaner salesman. That's why people hate it.

Most people who do all out advertising on here come on. They're short, to the point and say what they have. i.e. "auction on ebay" followed by the link. Or "Check out my new site". I've looked through Ben's catalog. There's nothing I want. It's not like there's going to be an absurd amount of new readers to the group daily and if someone is looking for a damn atari store, they'll go to groups.google.com and they'll type atari sales or atari store and guess what. they'll find 8bazillion ads posted by ben. But if he posted one every 2 months, they'd STILL find him.

Not *everybody* has a mental deficiency. So why make everyone suffer. I'm not going to filter this group or any other I read. It's about principle. I'm only now just getting to the point where I'll do anything more than add an rbl to my email server.

to put it simple. NOBODY is going to make a constant profit from atari 8bit or 16/32. But if you want to try it like B&C, fine, but at least don't be so absurdly annoying about it. Say it, don't spray it.

Alas I'm wasting my breath as Ben will never change. But at least reasonable people like you should understand what's really wrong (at least from my perspective).

Mark

Well, that's the first time I have seen this requested. I thought he
was to stop posting altogether. I'll admit, years ago, I thought his
list was quite huge, and a nuisance, but over time, it has dwindled it
seems, and with fewer people hawking wares, I don't seem to mind it
anymore. Has anyone even bothered to just ask him to post a link to
his site?

> As i stated above, group ethics are on topic, spam is off topic.

I think to be consistent, you should be speaking out against whoever
is posting the filth. It really makes your cause look off kilter when
you don't apply a level base of tolerance.

> > Bottom line, apply a filter to Ben's posts, and move on with life.
>
> Do you filter everything you disagree with or do you do something about it.

No, with the 20 posts in here on a good day, I just hop over the ones
I am not interested in. For instance, I don't own a Black Box, so I
don't spend too much time readng the posts about them, or getting
pissed because other people are making such a fuss about them. If
Ben's ads were annoying to me, I would filter him, and do filter
people in other groups. It's just the nature of usenet. When someone
is on tv spouting something you don't agree with, do you change the
channel, or launch a crusade against the tv station in hopes of
squelching your perceived enemy?

> I dont want to filter anyone, that was your suggestion!.

Well, by insisting that Ben stop, not only are you filtering Ben for
yourself, you are trying to impose your filter on everyone else.

It's much easier having an intelligent conversation. I honestly was
expecting a post telling me to ram a cartridge up my keister. I guess
it's just taking whoever is making those up, a while to gather his
thoughts, and tap out the message with the pencil in his mouth. Sad...

It's posted about twice a month.
The thread discussing his advert is the bulk of this newsgroup, is
criminally abusive while being simultaneously futile and itself has
generated complaints to ISP's. I'd rather delete his ad once a fortnight
(if it bothered me, which it doesn't) than delete the grizzling 10 times a
day.

I note you didn't respond to any other part of my message. Coward.

Well, I don't normally reply to stupidity, but I did. Please forgive me for contributing to the destruction of this Newsgroup.

My advice (which I didn't follow): Don't respond directly to these losers slandering Ben Smith and calling themselves the "Atari Liberation Front" (i.e. don't try to discuss this with them). They have shown me once again that stupidity cannot hold a coherent conversation. They sent me a personal threat e-mail in response to my last post - one full of overly repeated uses of "f**k", "s**t", and "fagboy" in reference to me, and promising pain and a "lesson". They obviously have mental deficiencies that prevent them from rational thought and peaceful, honest conversation.

Does anyone have any other ideas on how to get rid of this filth? I'm sick of wading through this to get to real meaningful discussion. Perhaps if we put our heads together we can come up with something. Their threats are obviously empty ones (besides maybe faking our personal e-mail addresses as their own in their posts), and there's obviously nothing they can do to the entire group if we *all* get involved and get this problem solved.

Any ideas? Ignoring them won't work in this case, as they are basing their posts on Ben's continued posts (which I personally welcome - just my personal view...). Other alternatives must be followed. I think this is the only thing related to these posts that is really worth discussing here. Thanks!

That's true. Also CAF AIF's are not common AIF's but compressed. I've found CAF has some problems with heavier imported 'real' AIF's. Slower screen drawing with small portions and timing with larger.

That may be right, I thought that Notator was fairly
easy to use but I started with its ancestor (Creator)
which may explain the learning curve passed :)

> Does any know a easy to use and advanced stuff for creating Music?

Anyway you also can try the Logic (Midi not Audio on the ST)
It is the superseder of the Notator and is really lots more
easier to begin and much more powerful when you get passed
the learning of the 800 pages of doc :)

(I used to use the Logic 1.7 and 2.0 and 2.01 on the STF
I don't know if the 2.5 works but it should)

If Vgacopy doesnt format 720K disks then there is a real problem.

"Format A: /F720" will format a 720K disk in DOS. Did you try that? I dont
have an XP machine in front of me so I cant check XP's pseudo-DOS to see
whether support for 720K's (and indeed 5"1/4 drives) has been removed.

Well, im not sure you should say "just an accelerator", the genius that designed it prowls this newsgroup :-) Its almost a complete 68060 computer on a card that has PCI and a DIMM slot (512MB memory stick anyone?) and connects to your Bus expansion connectors inside the Falc.

There is also a video card in development by a seperate team called SuperVidel. This is an FPGA based card so it is upgradeable. Its backward compatible with the Videl inside the Falcon, so all if not most software should be able to use it, and its lightning fast. Take a look at: Http://supervidel.atari.org/

Actually I think you both are mistaken. Looking at the mails that he
actually wrote (rather than the regurgitated spam he sends out) allows one
to get an idea about this man. If I wasnt convinced that I know who it is
who is actually hassling him, I'd be thinking that he was doing it himself
to generate the attention. What I am sure of is that he does read all these
emails, he wouldnt be able to resist, in fact he even replied to one a while
ago and his reply said that he doesnt read them....

3150. CT60 : 25 MHz bus on Falcon like the CT2

Newsgroup: comp.sys.atari.st
Date: 2003-05-31 09:33:31 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ed876e8$0$11650$626a54ce@news.free.fr>
Source record: 27032

This concerns only people who will boost their falcon mb fitting the CT60
WITH solders !

I correct some timings into ABE to allow 50 MHz clock to motherboard intead
of the 40 ...
This means that you will be able to replace the 40 MHz oscillator by a 50
MHz to speed the Falcon bus to 25 MHz and the VIDEL / DSP to 50 MHz, all
like the CT2.
But the CT60 offer something better : the write accesses are always in 3
clock cycles instead of 4 !
So, CT60 will offer same video mode than the CT2 but with better ST-ram /
video speed performances...

The ABE version (AB50) for 50 MHz is different with the one for the 40 MHz
(AB4x)...
CT60 have a 40 soldered oscillator, so they will be programmed with a 40 MHz
timing.
I call again that it is possible to program yourself the hardware chips
making a download cable between the // port of the falcon (or PC) and the
JTAG connector of the CT60.
If you want to see the schematic of this cable to realize it (I recommend
because some updates will surely arrive about ABE and SDR); download now the
1.5 MB CT60 archive at Didier Mequignon (see the link on my web site).

A last thing : if you have a 80ns 4MB ram card (the atari model), videl does
not read correctly the data for the screen (some noisly pixels).
So, the 50 MHz video modes are reserved for those who have 60 ns RAM like
EDO DIMM on a board (and the board must be well routed = I'm sure about the
CTR14, but I remember that some models have too long traces and get some bad
pixels on screen too).
For your info, 242 CT2 were sold and all were at 50 MHz : no videl were
destroyed as I know....

> seems, and with fewer people hawking wares, I don't seem to mind it
> anymore. Has anyone even bothered to just ask him to post a link to
> his site?

Long ago i requested that the size be cut to one short mail carrying a link
to a website ot even an advert for a private mailing list, he responded to
none of these suggestions and then started to post 3 or more long mails in
a session

> > As i stated above, group ethics are on topic, spam is off topic.

> I think to be consistent, you should be speaking out against whoever
> is posting the filth. It really makes your cause look off kilter when
> you don't apply a level base of tolerance.

I'm sticking to the issue i'm interested in, where it suits me. 8~)

> > > Bottom line, apply a filter to Ben's posts, and move on with life.
> >
> > Do you filter everything you disagree with or do you do something about
it.
>
> No, with the 20 posts in here on a good day, I just hop over the ones
> I am not interested in.

But there's the chance that one day that person you just filtered will have some usefull and welcome input, i may well use his services one day, i may well join a conversation with him, i'm not objecting to him or his living, but only when he stops his multi page spamming and replaces it with a short mail with a web-link will i let ot go.

> For instance, I don't own a Black Box, so I

Just ignore the powerless dick(s), they (if it's more than one mofo's
which I doubt) just fill the group with filth designed to show how
powerful they are and yet the fact that they can't stop their arch enemy
posting just proves how f**king useless they really are.

Dickless morons incapable of that little act so they stamp their feet
like spoilt little kids just to prove if they can't do the job in hand
and that they can cry like little girls as loud as possible while hiding
behind their nym, dizum etc places.

Very powerful...<shudder> LOL

What makes me laugh is how stupid they are, even if you find Bravo's
adverts a little too often as I do but say stop filling the group with
foul abuse you get called a 'Benny Boy' fan.

How f**king stupid is that, it just shows the level of reasoning behind
their thinking. This ALF thing isn't about keeping the group free of
spam, its about filling the group with their spam in some form of
competition.

Lusers

The best move is to add kill filters to both mail and news using the
below addresses, update them ad they swap around.

@nym.alias.net
@Gilgamesh-frog.org
@dizum.com

While the mails are PGP encrypted and routed via various remailers the end result is that only a certain number of free remailers do both news and mail anon so their options are not as big as they lead you to believe.

3159. Re: How to get .st (.msa)-images on real Atari disks on new PCs?

"Smeg" <smeg_007@NOSPAM.hotmail.com> wrote:
> If Vgacopy doesnt format 720K disks then there is a real problem.

Yeah, it's a strange behaviour. Under pure DOS it doesn't format
720kB, but under WinXP it does. *puzzled*

> "Format A: /F720" will format a 720K disk in DOS. Did you try that?

Yes, this works. It seems that VGACOPY doesn't like my floppy
controller for some reasons.

> I dont have an XP machine in front of me so I cant check XP's
> pseudo-DOS to see whether support for 720K's (and indeed 5"1/4 drives)
> has been removed.

But it's a Win95B-Bootdisk. Not a XP-Bootdisk. Don't know why it
doesn't work. I gonna try to get an older PC...

Cheers and thanks,
Uri

Hello Carey,

When I saw the Falcon being demoed at a past MIST, they were
mainly using it for playing music and vide samples. I am sure it
has many other uses.

If you want something simple I would try Tiger Cub. I have used on
my ST and STe and it works great. On my Hades I am using Sweet 16
which would also run on a ST. Right now, to my knowlege, Sweet 16
is the only midi sequencer that is still being supported and
updated.

I know I'm making that same mistake, and any response at all just keeps it going, but;

It is interesting to read some of this sort of exchange, and especially the message headers, just to identify the real nut cases and their location.

In light of all the liars, theives and other undesirable scum in the world, if a major thorn in someone's side is Ben Smith's spam, they must be having a pretty soft ride through life. Not to mention a lot of spare time to waste at their computer.

I read Ben's ads for a while, decided there was nothing in them of interest to me, and started ignoring them a long time ago.

The argument overBen has become more interesting than his Spam.

It's also quite obvious that the dickless wonder was recently caught
by his mommy masturbating to men's muscle magazines. Hence, the need
to vent their frustrations out where they have a false perception of
power. From the spelling atrocities alone, it's clear that you're
dealing with a sub-ten-year-old mind, so why bother to attept reason?
The communication is only one-way and the comprehension at the far end
is nonexistent.

BTW - after reading how many folks here notice his drivel, rest
assured that the perpetrator achieves a woody and runs into the house
to pork his daddy/uncle (same person) again.

Rodolphe,

If you already plan to overclock to 40Mhz, can you test 50MHz easily and switch back to 40 MHz? I get the feeling you can switch to 50 MHz oscillator and reprogram to test - if nonfunctional just reprogram back to 40 MHz settings and replace with 40 mhz oscilator..... Right?

Thanks,
Mark D.

Contrary to popular belief, in this world negative advertising is just
negative advertising... It's not like someone's going to go, "Wow. Look
at all those people who are so pissed off at him. I think I'll spend my
money there!"

This is an overzealous statement. If this ass manages to destroy the
group I would be more than slightly surprised. Considering Atari as a computing
platform has survived massive pirating, corporate death... and hey. MagiC
crashes too often.. that alone would be enough to make some people I know
give up and boot linux, I don't think there's really anything to worry
about. All this talk about death, destruction, blah. Nobody realizes
that the Atari community as it stands right now is THIN. I only pray that
there's a lot of dumb people having Falcons hiding shrinkwrapped in their
basement ;)

In fact the proper attitude for dealing with people like this is to
actually not care. Everyone can just "ignore" the bully, but if you're
sitting there fuming, the bully will still know it. As it stands he has
only one enemy, Ben, and has just one reason to post on a semi daily basis
(alongside of Ben's ads). If everyone starts attacking the hell out of
him we'll have to read that stuff (which is admittedly much worse than
ben's ads) all the time. No fun.

We all know the arguments about Ben's posts. They're unwelcome into my
world. As for stopping this guy? I'd say less than possible other than
distributing a killfile for as many anonymous remailers as we can find. I
don't support killfiling ben - he should listen to his potential customers
and change things a bit... at very least, it would be good business sense.
Unfortunately the whole idea that you can't stop one person from crushing
a group with crap is part of the (in)famous beauty of usenet.

Hey Rudolpe!
I have 2 Falcons, One with your wonderful CT2B, another with a
Nemisis. My hope has been that I would be able to install the CT60 on
the Falcon with the Nemisis without removing the the Nemisis. It's not
that I want the Nemisis on it, I'm just hoping to avoid putting the
Falcon back to it's original state because I'm not skilled with a
soldering iron. (I'm the guy who sent my CT2B MB to you for a proper
installation, and my parents picked it up from you directly while they
were in France. When you first saw my MB, your comments to me in email
were something like, "When I see your MB I had a vision of horror! Who
did this? The solders look like big turds!") ;-)
Anyway, the Nemisis only ever ran right at 20, but with this latest
developement, I guess it really may be desirable to take the Nemisis
out? (I realize it may have been nessesary anyway!) What's your best
guess?

You da man!

Hi,

I have put a new page on my website with an overview of my available downloads. Most of it is Atari/Midi stuff. Latest addition to the list is my latest project called MOZABCRT: It's a program that, using an algorithm based on W.A. Mozart's "Musikalisches Würfelspiel", fully automatically generates 16 bars of Waltz music, and saves the result as an ABC music file. Using abcm2ps and Ghostscript a postscript or pdf file can be created as well as a professional looking score print on paper :-)

Take a look at my new index page:

http://www.home.zonnet.nl/m.tarenskeen/download/
(or http://www.home.zonnet.nl/m.tarenskeen/download/index.htm)

You're not even located in America, so I doubt your words have much weight, Steve. Besides, only a low IQ individual would assume my words to be effort to actually GET the aforementioned $1 from anyone! You're not too keen on subtle sarcasm, are you?

However, it *would* seemingly be an easier way of "spreading the wealth", as it were, since you can pay people online! But it would require that all recipients be PayPal users and actually fulfill the requirement of the scam (send the whatever), lest it be shut down quite quickly via a slew of locked-down PayPal accounts.

In all actuality, I'd probably be even LESS likely to send someone money if such a suggestion were made... seems even more "scamish" (is that even a word?) than the "$1-by-mail" idea.

Personally, I don't think it would get very far as an idea... but it was a funny thought, tho.

Here's the problem.

Over the years Ben has responded to several suggestions made to him about his posts. For one, I emailed him about some simple stuff: When he first started crossposting to several groups made it unecessary post to each group individually. It was just a simple mistake and he changed his posting so 3-5 identical posts did not show up in all the groups.

Several reasonable people were also able to reach a compromise with him. Since they were not interested in his sales Ben prefaces all his posts with ADV for advertisment in the subject line. This made it easy to filter all of his posts even if he changes his email address.

Indeed, I suspect there are a lot of people don't even see Ben's posts because of the compromise reached.

Now you have a self appointed net cop who violates just about every rule of ISP TOS agreements. His time is limited since there are only about a dozen anonymous remailers. Things like deliberately defeating newsgroup filters by constantly changing your posting name, identity theft, etcetera, are all violations of TOS. Even anonymous remailers have rules.

It isn't that I particularily want to shut him up. He is free to rant as far as I am concerned. I just that I could ignore his posts with simple filtering. Like preface all his posts with ADV or RANT or something.

It really doesn't matter though. Soon as he burns his bridges with the anonymous remailers it will end.

I agree. SupreVidel souds promisin, very promising, but PCI slots gives much more possibilites. While SuperVidel is only a graphic card, PCI allows graphic, music, network cards. Especially network card is an interesting thins, I bet everyone (that does not have a clone) would like to have 100MB ethernet adapter?

2 PCI slots are enough for me (graphic+network card).

And please do not start with Aranym. I'm not against it (in fact I think it is quite cool) but please, leav that topic CT60-releated.

Sensible reply, there are only so many anon remailers (last time I counted maybe 15 I found that were stabel) , and they can all be gradually blanked in a kill script.... good idea

Anyway as we are Atari users, and I presume we have nothing to hide (grin) why would we need to use an anon remailer in this group?

In general yes, but depending on your OS you may not be able to use
all of the JAZ drive.

>Damn why is it so hard to access PC HD's on Atari when it is supposed to be
>native. Wasn't this hard on Amiga...

Om STs versions without onboard SCSI, you need an DMA->SCSI
adaptor. Parallel ZIPs don't work on the Atari due to some
missing lines on the printer port. Otherwise it should be
straightforward, provided the filesystem is the same (basically
DOS). I thought that the Amiga used a different filesystem
anyway...

That sounds like it's using the US keyboard layout. If you are using a Falcon, try the NVCONFIG.CPX to see which your machine is set to. But if the problem only occurs in Draconis, then it seems it may be hard coded in that program? (Wouldn't have expected that...)

Hi Chris!

If you have space on another partition, copy all the good files to a temp folder on it, then zero the partition with the faulty files and finally move the folder contents back to the now clean partition and delete the temp folder. If you are doing this with C:\, then the order in AUTO\ may be important. If you are using Kobold for copying, you can set it to keep the same order. If not, but copy from the desktop, set it to show the files in the AUTO folder unsorted, and then copy them one by one from the top downwards. Do the same when copying back, just to be safe. Other files and folders can be copied en masse.

Various programs can zero a partition (which wipes the root directory and FATS) - HDDRUTILS has 'Initialise partition' for this purpose. Make *sure* you are zeroing the right partition!

Hi Tim!

If you want HDDRIVER with an English manual (highly recommended),
then that is available *only* from Atari Workshop. They accept
credit cards. Price is UKP 29.95, which is around $48 at current
exchange rates, I think. Upgrades from earlier versions are
cheaper, though you have to return the original disk and manual.

email them on info@atari-workshop.co.uk

3189. Re: CT60 : 25 MHz bus on Falcon like the CT2

Newsgroup: comp.sys.atari.st
Date: 2003-05-31 21:32:00 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ed91f4b$0$12430$626a54ce@news.free.fr>
Source record: 26971

The boards are alrady assembled with 40 MHz oscillator .
This one is soldered.
Remove the 40 for a 50 osc is the pure responsability of the user...

I just explained it is possible IF the ST-ram card is good with 60ns DIMM on it.

After that, everybody will play as he wants No boost of the falcon with no solders OR boost at 40 MHz OR boost at 50 MHz.
Do what you want...

> Rodolphe,
>
> If you already plan to overclock to 40Mhz, can you test 50MHz easily and

3190. Re: CT60 : 25 MHz bus on Falcon like the CT2

Newsgroup: comp.sys.atari.st
Date: 2003-05-31 21:36:24 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ed92053$0$12468$626a54ce@news.free.fr>
Source record: 26972

I was thinking the nemesis is running at 24 MHz on bus , no ??
Only 20 ?? why ??

If the CT60 runs with a 50 MHz motherboard, this means that the CT60 will
run with all cards that boost to 20 24 or 25 MHz !
So, CT60 should run with nemesis at 20 or 24 or 25 ...

The only habitual problem IS : is your SDMA well running withoput any
problem on SCSI/FLOPY (corrupted data) and AUDIO (cracs) problems ??
It is rare that a nemesis has no problem with SDMA...

Rudolphe,
Very nice work. Cant wait to get my CT60. The
benches all look very good. Have you thought about
doing some real world applications for everyone
waiting on there CT60?? Like CAB, or Aniplayer. How
about MOVIES with Aniplayer. Is it possible to view
movies with the sound playing at the same time??

Thanks for the information in advance,
Carey Christenson

I don't bother formatting a disk before I write a .ST image. I just use STDISK and the V option to write the image and it works every time! See my other reply...

for a wand scanner! I have version 2.52 that runs on the Falcon but I
can't get it to scan into the computer. The wand lights up but no image
shows after holding the "start" button and moving the wand down a page
(screen either is freezing or the computer is waiting for data). Tried
holding the button down while moving the wand and without. I'm hoping it's
the software at fault.

Thanks for the feedback,

John G.

3194. Classic Computer show in Milwaukee Area

Newsgroup: comp.sys.atari.st
Date: 2003-06-01 00:09:45 UTC

Just in case anyone here lives in the Southeast Wisconsin area or the Chicago area the Midwest Classic Computer, Game System and Pinball show will be held next Saturday, June 7th in the Milwaukee area. Check out www.midwestclassic.net to get all of the information.

The event will be from 10:00am to 8:00pm
Nicolet High School
6701 North Jean Nicolet Road
Glendale, WI 53217

Tickets are $8.00 at the door or if you order by tomorrow night they are $6.00.

The Milwaukee Computer Society (formerly MilAtari) will be running a MidiMaze gaming event using 10 Atari STs. Our Club had run this event at GENCON for almost 10 years.

If you are in the area, come and check it out.

I will also have my MegaST running in a tower case on display. It was an interesting and fun project.

Well, the Nemesis actually has a Low and High settings. Older versions came with 40 and 48MHz clocks (running the CPU at 20 and 24MHz and the DSP and FPU at 40 and 48), and the newer versions have 40 and 50MHz (20/25 CPU) clocks.

3197. Atari Magazines (and more) for sale

Newsgroup: comp.sys.atari.st
Date: 2003-06-01 06:51:13 UTC
From: Anthony Iannone <aiannone@nis.net>
Message-ID: <CnhCa.24689$NC4.115363@news1.mts.net>
Source record: 26979
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Hello everyone.

I have a whole lot of Atari magazines for sale, mostly ST but some 8bit,
along with a few other items. The magazines and other items are listed
for sale on EBAY. Here is a link for the auction list:

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&include=0&userid=aiannone%40nis.net&sort=3&rows=25&since=-1&rd=1

You can alos go to EBAY.com and search by seller, using seller id
'aiannone@nis.net'

All the goods are located in Winnipeg, Canada, and I only charge actual
shipping rates. Prices are very low (too low!)... And there is a C=64
available for all you trolls out there ;)

Regards,
Anthony

No, it doesnï¿½t. It boots, but as soon as I move the mouse it freezes.
Anyway, it works on my Mega STE 4 on the Crazy Dots II in 800x608 in
256 colours. To me, a bigger space was much more important than
multitasking.
BTW: LIVE uses MROS, which means you can use all those nice drivers :)

NO.

> It detects the 060 and adapts...

The DSP video codecs are not used if the 060's cache is used. because the 060 is lot of faster than the DSP and the host port. Only DMA can increase performances for the DSP, like MPEG Audio decoding.

I need lot of time for optimisation, I have just worked 2 hours on Aniplayer since 6 months because all my free time is used on the CT60 ;-)

Programs for extracting are not the problem - all you need to do is to dump
the corresponding memory area.
The problem in that case is that you need to relocate the TOS if you want to
load it from disk. You cannot directly use a TOS dump as a boot disk.
But you could use such a dump to create EEPROMS which would allow you to
boot the 520ST without the need of a TOS disk.

I have an Eclipse BUT, I want to try and use the ATI
Graphic Card with the CT60 until the CT60 Graphic Card
comes out. I may even consider using the Deesse card
with the Eclipse if they decide to support the Eclipse
PCI card. If not then I would love to sell the
Eclipse and the graphic card if wanted to anyone who
needs it.

Thanks,
Carey Christenson

Hi Nick,

>I third it, it is the best on the Atari platform

I don't ;-)
I thought it was common knowledge by now that SPIN! is the most versatile CD-R driver on this platform, browsing through the replies in this thread one would think the Anodyne package is the only one available.... another option is MetaDOS, freeware and every bit as good as the Anodyne package.

Since all the poster wants to do is extract audio tracks and convert them into *.AIF format I would even go as far as recommending him not to use a driver at all.... CD Lab extracts audio files just fine, and all it needs is a recent version of HD Driver.

SPIN! : can be downloaded from the Chapelie ftp server
METADOS : can be downloaded from the Chapelie ftp server
CD Lab : http://cdlab.atari.org

Cheers from Belgium
Dennis

Hi,
I'm in the process of putting my STE mainboard into a PC Towers
(practice before doing my Falcon) but am having a problem with the power
supply.I know I have the +5, +12 and GND wire connected properly but when I
plug it into the board nothing works; not even the PSU fan turns on, but as
soon as I unplu the connecter from the mainboard the PSU's fan turn on like
it should. Any suggestions? Thanks

Nicholas

Yes, I was assured that I could copy the TOS PROM's and install
them in the Atari 520 ST. But if I could have created a boot
disk, I could test the computer to see if it works...before I
went to the extra expense of burning the EPROM's...

It was just a thought...

It is using evnt_multi from the AES for querying the keyboard. The keys are
put directly without any mapping to the editor/edit fields.

> obviously wrong.

Yes, I see some misunderstandings arising in this thread (and also in the Atari Midi mailinglist where your problem was posted). A bog standard unaccelerated Falcon will be somewhat sluggish in response while playing many audio in Cubase Audio, but it's timing will be immaculate even playing 8 tracks of audio and loads of midi tracks. If it isn't, something else is wrong.

Maurits.

3223. Falcon + Nova problems

Newsgroup: comp.sys.atari.st
Date: 2003-06-02 08:35:53 UTC
From: purpletwilight3000@yahoo.co.uk
Message-ID: <2bfabd3.0306020035.352cc633@posting.google.com>
Source record: 26904

I'm trying to fit a Nova graphics card to a Falcon.
The unit plugs into the Falcon bus extender fine,
and I've wired a floating wire (marked +12v on the
nova card) to the 12 v line.

On booting there is some noise (coloured lines) on
the display, and then the system crashes after the
HD driver starts.

The Falcon is a stock unit, completely unmodified
except for the clock buffer mod.

To confirm - I tried this on another Falcon with
the same results.

There also appears on the Nova card a solder pad
(which has never been used) marked -12v. The manual
is in German - so not sure if this is needed.

Anyone out there using a Nova on a Falcon?

Cheers

PT.

I've ordered the Magic v6.2 upgrade from AW, but El seemed reluctant
to issue CAB 2.8, saying it needed something changed in the executable
from ASH. All a bit strange.

Magic hasn't arrived yet so I'll be giving him a call again...

Did he ever charge that much for anything? Whatever it was and however
long ago it was it seems like time to get over it. When was the last
issue - more than 5 years ago at least!

I remember getting my first issue of STApps for nothing because he did
a free mailshot to everyone. I remember him refusing to take money
from me at a show when I wanted to upgrade some stuff. I remember his
free support and advice on CiX. I can't believe he got his money's
worth from organising compiling, editing and distributing his magazine
or PD library. Nor for taking on commercial distribution of commercial
software.

Like I said, I feel I got more than my money's worth, and if I lost a
tenner at the end I can live it.

If there's one main trouble with people from round here, it's that
they bear a grudge for an unreasonable amount of time...

Make sure the 12V is connected properly, I use the capacitor next to the
PSU, number 138 or something like that.

NOVA will only work with 4mb falcons and wont even start if you have a
14mb moduel installed.

Fredrik.

Source record: 26911

It is possible to use TOS versions by loading software images of TOS (tos.img) during boot time. You need a program for this in the AUTO folder, like tosboot.prg or seltos. Besides the tosboot program, you need the software image of your desired TOS version: these images are lying around on the internet, for example try Little Green Desktop. More than 1 MB of memory is also very welcome if you still want to do something useful, since the TOS will now be loaded into the precious memory of your Atari... Most of the software versions of TOS will survive a reset (but obviously not an OFF/ON).

Maybe is this what you mean. You can put other programs on this bootdisc too.

Seltos works for me, replacing TOS 1.6 by TOS 2.06 on my STe.

More info and download of Seltos.
http://home.hccnet.nl/v.d.burg/atari under TOS.

Regards,

Jos

I wonder whether the ST in question is a very early one with most
of the OS on disk, with the ROM just holding booting instructions?
If so, it would need the special boot disk supplied by Atari.
Don't know of a source, sorry. Otherwise I see little point in
saving the 1040s ROM and using it.

There was a disk available from Goodmans PD called TOS CHANGER.
This allowed you to run virtually any old software. Booting with
the disk gave you the choice of using TOS 1.0, 1.02, 1.04 or 1.62
and EOS 1.42 and KAOS 1.40. From the instructions:

--QUOTE--
XL8R is an ST Translator disk. I have taken a number of actual ROM TOS
versions, and made them relocatable. When executed, they will relocate
themselves just underneath the TOP of your (ST) ram.
--UNQUOTE--

Don't know if it worked with those early STs having the OS on
disk, but I doubt it.

BTW, my copy is on an 823 KB (82 track 10 sectors) extended format and
I couldn't read a couple of clusters of the instructions. If anyone has
this disk, I'd be grateful for a copy of a complete INSTRUCT.DOC

Regards, /Peter/

Message-ID: <200306021927.a42406@wun.maus.de>
Source record: 26929

Hallo Fredrik!

FE>NOVA will only work with 4mb falcons and wont even start if you have a
FE>14mb moduel installed.

It will also work with Falcons that have the Magnum RAM expansion installed, provided that the magnum driver is set to use only 6 of the 8 MB on that card.

To test the card: Do _not_ install the drivers, and start the init program from the desktop on a monitor attached to the original Falcon port, followed by the VMG. Check with the VMG (test option), that some of the available resolutions work with your monitor. And best set the boot option of the driver to "wait 5s", so you've got enough time to call the boot menu.

That was kind of my point there. One less 's' there in my case, and
one more 'a'. (Isaac) Anyway..

> Long ago i requested that the size be cut to one short mail carrying a link
> to a website ot even an advert for a private mailing list, he responded to
> none of these suggestions and then started to post 3 or more long mails in
> a session

Well the problem I see here is that by the same token we cannot get
someone to stop posting profanity, we can't stop Ben from posting. I
still maintain that the chatter level in this group is so low that it
would only take a mere few seconds to skip over any thread that was
irrelevant to you. I read much larger groups, and as the level of
posts increase, so do the people who think they need to post their
beliefs on all manner of topics. I tend to look at posts like Ben's as
billboards along the road of usenet. They have their advantages and
disadvantages, and yes, sometimes can get in the way of a really nice
view, but you can always move on and they are out of your way. I know,
bad analogy, but who cares.

Sorry, I just think that if you are going to crusade, make it an even
crusade. It really destroys credibility when you will point fingers at
someone, and let another person doing the same or worse actions slip
right on by. By having an actual civil discussion here, I could see
everyone eventually at least coming to some sort of an agreement. If
we didn't have people playing childish games, then you might have a
chance for advancement of your cause. Besides, it's not like we don't

have other vendors doing exactly what you are asking Ben to do. Look
at Lance and Rick. They both have catalogs full of items, and have
relegated their advertising to web sites. They post and contribute to
the group. What you are asking isn't outrageous, but when you come on
and castigate Ben, and don't castigate someone posting filth, then you
negate your credibility. While you might have one issue in mind, you
are allowing bias to lower your ability to tackle this issue.

I only filter a few people in a few other groups, and that's because
they have been posting off topic drivel for what seems like years now.
I still maintain that the number of posts in this group has dwindled
to almost nil, and skipping over a single advertisement at the
frequency he posts it at is negligible.

I personally don't care one way or the other. The real reason I spoke up in the first place is that the way I "saw" it, and that's previous to our conversation, is that if someone like Lance, or Rick, or anyone else established as a retailer of Atari wares posts, they would be the victim of an obscene tirade. Which at this day and age, with the amount of people with stocked amounts of Atari equipment, would be a loss in my point of view. It's not like we can pick up an Antic magazine, and search out the cheapest price on a 1024. We have to hunt down whoever might have one, and it seems that this is the arena for most of the atari activity, at least it seems that way to me. I have the feeling that if someone had an ebay auction as of late, they cringed at the thought of posting it on here, for fear that they might open their newsreader the next day to find that they have posted about sodomizing the president.

You have stated what you would like to see changed, and frankly I have no problem with that, as long as we are even handed about it. Like I said, it seems that other vendors already work in this manner.

For Auction:

Atari Falcon fitted with an Afterburner (68040 with FPU built in)
and 16M Fast RAM. 4M of standard Falcon RAM makes 20M total.

Recased in a Desktopper case with a 120M HD and CDROM drive
on the secondary layer. Also includes a Nemesis accelerator,
and the clock buffer mod. The Afterburner also features a
through port for the Falcon bus, allowing other (compatible)
cards to be used.

I get the impression that there are not many companies left, that sell Atari 8-bit equipment these days.

Bravo Sierra Computers offers Atari equipment to Atari 8-bit enthusiasts and from what I have heard, the company treats these enthusiasts (its customers) in a fair way.

No complaint in this newsgroup seems to be about how Ben Smith treats buyers of his Atari equipment.

If that is correct, please leave Ben Smith alone. Selling Atari 8-bit equipment to enthusiast users is a positive contribution to what remains of the Atari 8-bit world.

Whatever is irritating about Ben Smith and his company, it cannot be worse than all these articles about f-gs, assh-les, s-x toys, et cetera.

Anders

>
>
>Printer (sender) Atari (receiver)

The left side is the _printing computer_ and not a printer :-)

>36-pin centronics 25-pin sub-d
>Pin number, name Pin number, name
> 1 _STROBE_ --------- 11 BUSY

This is OK. Sender vill make it _low_ when there is valid data on the
data lines. The receiving Atari will get a BUSY signal when this signal
returns to high again resulting in an interrupt where you can execute
code to handle incoming data.

The interrupt happens at the very end of the "data valid period" so the
receiver has to be very quick to read the data bus.

The signal goes from left to right on this line.

> 2 Data 0 ----------- 2 Data 0
> 3 Data 1 ----------- 3 Data 0
> 4 Data 2 ----------- 4 Data 0
> 5 Data 3 ----------- 5 Data 0
> 6 Data 4 ----------- 6 Data 0
> 7 Data 5 ----------- 7 Data 0
> 8 Data 6 ----------- 8 Data 0
> 9 Data 7 ----------- 9 Data 0

Also OK but you made 7 typos to the right (should be Data 0-8) :-)

>10 _ACKNLG_ --------- 1 STROBE

Interesting! _ACKNLG_ might be sent from the receiver and the sender
might be listening to it. This line would be used from right to left for
handshaking.

Note that Atari ST(e) and TT does not listen to _ACKNLG_ so having any of these on the left side would make this line pointless.

I think the Falcon does listen to _ACKNLG_ and generates an interrupt but I have no Falcon...

My sending computer does not listen to _ACKNLG_ either, equal to an ST or TT. So, this will simply not work with my equipment.

>11 BUSY --R=1.2kOhm-- 22 GND

This is no good either... As I have no _ACKNLG_ on my sender the BUSY signal would be the only way to make the left sender wait until the receiver can read the next byte. So by just forcing it to low data will flow without any handshaking at all.

In my cable the connection is:
11 BUSY ---------- 1 STROBE

The idea here is that the receiver controls STROBE to inform the sender if it is busy or not. This signal goes from right to left.

The right side STROBE is normally high but can be forced low be the receiving program acting as a "printer emulator". As the left side only sends more data when its BUSY line is low this is my way of getting handshake.

It should work just as well as the _ACKNLG_ way in your cable. After all this is the standard way of getting handshake when an Atari computer prints to a real printer.

What's left to experiment with is how long the receiver must keep the BUSY line of the sender low to get the next byte. It should work to keep it low until the receiver executes the interrupt routine and put it high again from there. Also this line has to be put low before the transmition begins.

Afaik this exacty what the code provided by David Bolt in

http://www.my-ste.demon.co.uk/files/readpara.zip

does but something is wrong as it does not work...

>12-15 NC
>16 GND -------------- 22 GND
>17 NC
>18 NC
>19-30 GND ----------- 22 GND
>31-36 NC

The grounding above might be worth checking! My cable does not have these "crossed" ground connections.

>
>(All GND tied together)
>

>So, strobe of the sender goes to busy on the receiver, but strobe on the
>receiver is linked to acknowledge on the sender and the sender's busy line is
>just connected to GND with a pull-down-resistor.
>
>The manual states that it's not possible to use an Atari as both sender and
>receiver.

As my sending computer shares the missing _ACKNLG_ line with (older)
Atari computers your cable would possibly not work with my setup.

P.S. If only those who keep spamming this group with unwanted followups
to Ben Smith's ads would spend as long time writing a single message as I
did on this post... :-) D.S.

Well, what I'm saying is that I think one of the big factors that has reduced the number of posts here in recent years is all this crap that keeps getting posted that is either profane, slanderous of Atari-related people or things, or simply irrational off-topic posts annoying the long-time readers of this group. The stupidity posted by this specific person or group of people falls under all three categories. I'm just concerned that as the percentage of these posts compared to on-topic, rational, and polite posts grows, people will abandon this group in larger and larger numbers. This is one of the few places most of us have to rely on to know what's going on in the Atari community, and it's dwindling away very quickly.

> I haven't contributed much to this group in a while (as far a real

But for those (I guess few) of us who actually welcome Ben's posts, how do you filter someone who uses the same threads and masquerades his e-mail address as other legit people whom you want to read the posts from?

> I wouldn't take anything personally here (even though Sinplop almost
> had me ready to meet him at a Slack convention to kick his ass:). That

> transvestite?) isn't a challenge at all, and find him amusing.

Well, I don't find his personal threats that he's sent to me via e-mail very amusing. I find them profane, slanderous, and annoying. Which makes his/hers/its posts here all the more annoying, and I'd personally like to

find a way to eliminate them without eliminating the stuff I do want to read.

> Eventually, after going through several remailers, we'll get to his

This is sort of my point, though. The Atari community is thin. This
newsgroup has been an invaluable resource for me, personally, and I've
watched it progressively shrink over the years, and many who've jumped ship
did so because of petty things like this. Yeah, I guess destruction was a
bit harsh. It's more like erosion. The community is so small, even if a few
key level-headed people stop reading and posting, it's a definite loss for
the group.

Bonjour :)

You can find an adaptation for GEM environment
of Manga Puzzle (originaly written by Cooper/Paradize).
It's a 'taquin' game as we call it in France.

Download at http://rajah.atari.org or directly at
http://membres.lycos.fr/nef/files/ -> manga.zip (450 Kb)

Carefull: couldn't fix the SNDH routines management so
it may be crashy, depends on some SND files and OS.
ST-Guide doc is provided.

You may prefer Yoai rather than Hentai...
So an util will be available for gamers who want to have
their own set of images.

Have fun :)

I checked my computer and it has the following connections.

Pin 1 +5 Red
Pin 2 G Black
Pin 3 G Black
Pin 4 G Black
Pin 5 +12 Yellow
Pin 6 +12 Yellow

I'm not sure if the STe used the same 6 pin connector.
I just hacked apart a connector like the one the Atari uses and hooked
it too a Male type plug that the PC case uses. This way I could plug
it into the standard PC type trapezoid plug.

The other problem you might be having is if the case is actually an
ATX case. THis needs a signal from the Motherboard to start power.
This shouldn't be the case though if the power supply fan starts when
the MB isn't attached.

Theft is theft, I lost £20 and I will bear a grudge as long as I live and
would physically attack him given the chance, I don't think this is
unreasonable, at the time I was unemployed and £20 was half my weeks income!
, the guy took the dishonest way out of a situation he placed himself in.

3254. CT60 : the cause of SDMA problems with SCSI/Audio is known !

Newsgroup: comp.sys.atari.st
Date: 2003-06-03 14:02:58 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3edcaa86$0$12422$626a54ce@news.free.fr>
Source record: 26936

During this last 10 years, everybody heart about 'cracks' on audio or SCSI/floppy data problems, especially when boosting the mb.
Atari furnished a patch with a 74F08 onto the GAL U63 to bufferize the bus clock going to 3 directions, especially the SDMA, and this on standard falcons.
This patch was called 'Cubase clock modification' for those who had to install it.

OK, after several month passed several years ago on CT2 to fix this problem, I was not sure to know the real raeson of the problem.
Every body (and atari) was thinking that the bad quality of the clock to SDMA was the cause of the problems (so the 74F08 fitting).

But after using the 200 MHz logic analyser I can reveal that the first reason is a big bug into the VIDEL chip !
Some times the data arrive later (Videl switches the 32-bit memory bus to the 16-bit CPU bus) and because the timing to latch the data from SDMA is very short, some data are missed !

All the patchs like 74F08, nemesis termination with resistor on SDMA clock trace are not perfect at all !
Their just modify the edge of the clock and allow to win 1 or 2 ns when latching the data !
But the bug into VIDEL is depending too of the Video resolution you use and the temperature of the machine !

I now design a patch that will simply add a Wait State to the SDMA transfer to be sure that it latches the data when really present & stabilized on the data bus.

Anyone?

This could be very important to help extend the life of our Falcons, at
least giving us the ability to use USB printers, as parallel port printers
are getting rare. :(

And not to mention digital cameras, scanners, etc etc!

Cheers,

James

Hi gang, this is my first post to the group.

I just pulled my STacy out of the closet, hoping to get some use out of it,
but there's a new problem that I didn't previously have:

During the Win95 days, files were easily shared between PC and ST on a
TOS-formatted disk. Now my Win98se machine isn't reading the Atari disk,
and vice versa. How can I share files between the two machines?

James,
I most definetely aggree with you and SMEG!!! I
wonder if Rudolphe Czuba would be interested in
designing a USB 1.1 or 2.0 HUB that could attach lets
say 2 to 4 items at a time. Any thought on this would
be good time invested.

Thanks,
Carey Christenson

I don't recall the version I have, but I've noted that although
TouchUp works fine on the Falcon, the wand scanner doesn't. Hence I
stopped using it.

Doesn't surprise me! So, is this why some RAM boards make fuzzy marks
on high resolutions, this gets worse with temperature for sure.

Lyndon

that's all well and good - but in order to make use of the USB ports,
you're going to have to make USB drivers to go with them. A digital
camera one might not be too hard, but getting ones for printers is going
to be a lot tougher.

Yes you guys are... You guys need to get a freakin life man, This is pathetic. So what, a guy keeps posting the same ads on here. He is doing a service to all you pethetic Atari freaks who don't have a life... Maybe someone needs a part of something, what if someone NEW joins tomorrow? It would be nice if in a week Ben posts about his services and that person gets in touch with him about getting a part he needs... Not finding an ad 6 months old wondering if he still is in business to satisfy you anal idiots. There is no marketplace on here, maybe we should get a comp.sys.atari.marketplace or something! Would that be ok with you guys!??!?

Stop whining about it and try to turn off your Atari once in a while and get laid.

Don't get me wrong I do love the Atari, and some things annoy me too but this is just getting really old.

Leave the guy alone, if you do not want to read his posts ignore them. Resorting to wasted bandwidth, profanity and graphic texts about your "closet" fantasies it really getting old!

Damn sick of all this crap.
Tim

Daniel,
That is all well and good. But Phototip could be
easily adapted for digital cameras and I am sure that
HDDriver could be adapted for Hard Drives to use USB
ports on the DSP port of the Falcon. The only other
issue would be printer drivers for the DSP port/USB
port. We have a ton of talented programmers out there
that I am sure could do this without problems. Am I
wrong on that???

Thanks,
Carey Christenson

Nope.

If we can get some heads together, like some people into "c".
Have them do some checking and find out what usb card is most widely supported in the open source community. Determine what might be more easily ported to mint. Before anyone has a tizzy, mint IS the most robust OS and open OS we have. It's the best point of entry, and the quickest point of entry into the world of USB. I also would suggest it be a pci card and first be developed for the hades and milan, as they already have a pci bios for such things. Then if a functional driver ever came out of the project it could be adapted to other machines. It's already been proven you can hang an isa card off the rom port.

Anyway, if we could agree on which card to start such a USB project with I'd gladly run out and purchase it and mail it to Ozk at my cost, so he can tinker with making a USB driver. I'm absolutely serious, but I will only ship him a pci card for the clones.

Does this mean that a CTII Falcon could be adjusted as well? Some of
us with CTII Falcons (like me!) have had SCSI problems, and programs
like Scanex and Cubase audio not working.
Just a thought,
Mark

Gak.. was the ATW800 really that expensive..?

I know they were very high, but I'm drawing a blank on the actual
figure.

This one appears to be only a single 20Mhz processor system, with a
minimal amount of memory installed.

Sure- this thing will operate as a standard Mega4 ST (if more RAM is
added- right now it only has 1/2 Meg installed on the ST side), and
has all the standard ST ports for dongles, so it'll probably run
Cubase just fine.

Too bad it's so heavy..!

lp,
Thanks, for the support. I know alot of these
talented programmers as I have talked with several in
the atari community. I believe the biggest mountian
we have to climb is actually deciding on what card to
write the USB driver for. Once the USB driver is
written it really is just a matter of the software
recognizing that the USB port is there and making a
connection to do what it needs to do best. Which is
I/O. Hell, I would even support you in sending that
PCI card to OZK, and I dont even have a Hades or
Milan. Because I know in the end something would be
developed for the Falcon that would work also. Come
on guys lets bang our heads together and see what we
can do about this!!!!

Thanks,
Carey Christenson

Plain 520STs had to, the later mdoels like the 520STM, the 520STFM or the
520STE had ROMs.
But it is really no big deal to upgrade an old 520ST to use a ROMs.
The sockets are there.

The USB problem is one that will effect all Atari computer users
although developing a Falcon solution my be easiest due to its
hardware it is also a short sighted approach as the more Atari user
there are that can no longer use there computers because they can not
connect basic preiferals such as Mice, Printers and Joysticks the
smaller our community will become as some will decide it is no longer
worth the effort to continue using them.
I can't remember if it was on comp.sys.atari.st.tech or
comp.sys.atari.programmer but the USB problem was discussed there a
week or two back and someone has developed a USB card for their Atari
8 bit computer that runs of the cartridge port (as reported in the
January issue of My Atari) which would make it available for all Atari
computer owners. If you have not yet seen or heard of it follow the
link below.
http://www.strotmann.de/twiki/bin/view/APG/ProjUSBCart

If you still want to develope a Falcon only soultion you may find some
useful stuff there to get you started.

You could use a null modem cable and appropiate software the name of
which escapes me right now (ghostlink ?) to transfer files between the
two.
Alternatively format the floppy in your PC, you should have a 720K
option somewhere in the format box , if you can't find it try clicking
on 1.44Mb and see if an option box appears.
You should note however that in my experiance the current Windows file
systems and even that on Win95 places spurious file data (usually
filename with no clusters assigned) on the disk which tends to mess it
up, you can get around this in the short term by using a program like
ST Tools to remove these errors but after copying files from the PC to
the disk several time it usually messes the disk up so much that the
Atari will refuse to read it and you will have no choice but to
re-format the disk so dont place any inportant files on the disk that
are not backed up elsewhere.

Thanks,

I had 14M installed - that was the problem. I changed it to 4M
and it works fine now.

> It will also work with Falcons that have the Magnum RAM expansion installed,
> provided that the magnum driver is set to use only 6 of the 8 MB on that card.

I actually have a 8M 'FASTRAM' Magnum card (fits on the Falcon bus) is
that useable? I noticed though the Magnum doesnt have a through port
fitted, although there is space for the plug to be soldered.

PT.

That situation applies equally to a clone user regardless of the number
of machines out there.

There's no firewire either, so would it be best to dump our machines?
I think most Atari users are not that quick to bail, and most would be
willing to wait for a driver and might agree the clones do offer a quicker
solution during the development stage.

The idea of only developing for clones is not the goal, the goal is to
get something USB related running, because currently we have zero
usb support. Once something is running on the clones the bulk of the work
is done. Moving it to other machines would be a lot easier at that point.
The falcon has dsp over a clone, otherwise I don't see where it would be
easier on a Falcon from a developers standpoint. The clones already
have a pci bios geared towards devices using IO hardware and a pci slot.
No adapter required.

> If you still want to develope a Falcon only soultion you may find some
> useful stuff there to get you started.

In this situation you also need some adapter hardware first.

So far only Ozk has expressed any interest in actually tinkering (codewise)
with the idea, unless I missed a post due to my kill file. ;-)
Also I think I know Ozk fairly well, if he gets his hands on a usb
card his tinkering would lead to a mint driver for the clones initially.
I'd bet money on that. ;-)

Anybody recommend a pci card yet, so I can get the ball rolling?

I'm fitting a 2.2G 2.5" IDE drive to a stock Falcon to replace a 720M drive. However, when trying to format the drive with AHDI it goes ahead and formats the drive but complains it cant write the partition information. Is this a known problem with AHDI?

Cheers PT.

Hum, maybe a head alignment problem wich is frequent with old Atari drives...
I never had any problems with PC formatted disks on the ATARIs. In fact, i use
FDFormat for all my disks and WIN95 understand perfectly what is a 820k disk!

Have a good day!

Hello!

> I actually have a 8M 'FASTRAM' Magnum card (fits on the Falcon bus) is
> that useable?

Yes, but you need to configure the magnum driver to only use 6 MB of RAM.
Otherwise the Nova card don't work.

> I noticed though the Magnum doesnt have a through port
> fitted, although there is space for the plug to be soldered.

I had this configuration running some time ago (until I got an
Afterburner).

- first, I'm hapy to announce that the CT60 is running fine at 66/20 now and the SDMA problems are fixed (it seems)..
But I need yet to verify with a SCSI HDD.
At 25 MHz it's boot well and run fine too but the SDMA gives me problems I know how to solve. Should be finished this evening.

- second, I can tell you that le HDD driver CECILE 2.18 is running fine on CT60 and allows to use the old CONNER 2.5 IDE 80MB that doesn't run on 20 MHz bus with HD Driver (too fast surely) and has some problems into the Kronos HDD test with 16 MHz Bus.
But, it is clear that using a such old HDD on a falcon with a CT60 is really a shame !

P>that useable?

Yes, that's exactly the card I was referring to.

P>I noticed though the Magnum doesnt have a through port fitted, although
P>there is space for the plug to be soldered.

That's common with these cards. Just solder an appropriate set of pins there,
and place it in between the nova adaptor and the mainboard.

The problem I've personally run into is that *none* of these programs
recognize that my SCSI Yamaha CD-RW drive even exists at all, whereas the
Anodyne software has no problems recognizing and running it quite well. I've
followed the doc's for MetaDOS, SPIN, and CD Lab to the letter, and followed
helpful relies here in c.s.a.s., and it's always turned out the same: they
don't work and I am repeatedly recommended the Anodyne package instead. So
personally I wouldn't say SPIN is the *most* versatile CD driver. It does
nothing for me.

> I also tried Notator but too complexe when you don't be the Conceptor
> of Notator.
> Does any know a easy to use and advanced stuff for creating Music?

I write this as an avid user of many sequencers for several different platforms. If you have a Unitor and or Export, this sequencer is very hard to beat. It's worth the learning curve, which really isn't that bad if you simply sit down and tackle it, learning features on a 'need to know' basis. Make a copy of the key code pages, look at it when you need it, and you'll have it down second nature in no time flat. Most of it makes sense anyway...I.E. hitting the n key takes you to the score or 'note' editor.

For general use Notator isn't much more involved than any other to run. Walk through the tutorials and you're quite compently making and editing music within an hour or so. Once you begin to grasp the concept of how Notator is laid out, it really is snappy and very easy to work with. The addition of a unitor really makes it a nice sequencer to work with. Before you know it...you'll find yourself free of the cumbersome mouse, driving your sequencer with simple key taps as if were an extension of your midi keyboard. Ummm, actually, you can even drive it remotely from midi keys, sliders, pedals, etc...if you like. Want to be able to change what that pitch wheel does on the fly with one key punch? Easy enough, Notator has programmable macros that will let you make numerous alterations with a tap of a single key...on the fly!

For more advanced things, Notator is very hard to beat. The beauty of this sequencer is the real time engine built into it. There are a truly amazing set of filters, maps, and ramps which allow you to alter your playing in real time, wether the sequencer is recording/playing or just sitting idle. The sequencer records exactly what you play in to tracks, and this does not change unless you 'normalize' the track into something permanant. In essence, this adds a ton of very useful real time abilities to your midi set up. To some degree, CuBase works on the same principle, but it's not nearly as flexable *without delving into the art of programming your own CuBase modules*.

Notator timing is rock solid on the atari and unitor midi ports. The resolutions offered are perhaps the highest for any sequencer ever made (this baby had SMPTE locking in mind from the get go...so you can lay events down to the micro second if needed). It's also damn hard to crash. Over 10 years of using it, I can count the lockups or freezes on one hand, and those were never duplicated. Wanna do hudge sysex dumps on the fly...perhaps load a bank of sounds to one synth mid-gig while you're using sounds on the others? No

sweat...Notator
can handle pretty much any dump you have enough memory for...even sample dumps! Doodling around and find a groovy riff, but weren't recording at the time? No problem, it's still in the real time buffer...normalize it into a new track and see what you did! Wishing that programmable slider or wheel on your midi keyboard could send out more than one message at the same time (pan and modulation for instance)? No sweat for Notator...in fact, you could even trun the wheel upside down and alter the resolution to midi output 1, and do something entirely different over midi 2 with same wheel/slider.

What does all this 'real time' talk mean?
Imagine that you'd like to use 3 midi instruments at once. Using Notator you could effectively do the following, and much more.

MIDI 1/primary controller: Split the keyboard in 3 zones, the first several keys reserved as silent for a drum layer, the middle playing a bass, the right a piano.

MIDI 2: Add a doubling bass patch transposed an octave down for a thicker sound, and a string pad that corresponds to the keyboard zones described above. Invert the keyboard from right to left in the far right zone (so it actually plays backwards). Filter the drum zone into silence for this midi instrument.

MIDI 3: Remap useful drum sounds to a zone of 5 keys anywhere you want them. Create a live midi echo to these drum sounds of 7 milliseconds. Add 5 to the key velocty *to give this insrument a little more punch*. Filter out after touch data since drums don't use it anyway. Change modulation wheel from mod to pan for this instrument only.

All this can be done live, on the fly...wether you're recording or playing back track data or not. This is only the surface of things that can be done in live or studio situations where you'd like to reroute and/or alter midi data on the fly, or in recordings. As you can imagine, this is like being able to do hours and hours of synth patch edits in a matter of seconds, all from one place, in convienent libraries that can be loaded at will and applied to your sequences or live playing as you need them.

Every sequencer has its unique sweet spot of course. Notator has many!
I'll admit that at first glance, other sequencers seem more intuative, and of course there are certian creative situations where the others are simply more fun to use. None the less, I've never met anyone who took the time to learn Notator who regretted it :)

After checking, what I have is a 520 STFM. So what version of TOS
does it have??? Assuming that I can get it to boot, is there some
location I can peek to see what version of the TOS is there??? If
I open the case, is the version written on the ROM chips???

Plug it in, turn it on.

If a few seconds later you're looking at a green desktop with white
icons, it has TOS IN ROM.

Almost ALL 520STs came with TOS IN ROM.

Only a very, very few, at the very, very beginning were rushed to
market with the disk boot TOS.

AHDI will limit you to 1 GB partitions. Divide your drive into 200
MB, 1 GB, and 1 GB and all should be well.

Ben,

Marek is probably right about the DIY kit.

But if you really want to do this, be careful. The 1.44 disks use a lower magnetic charge for writing and the disk magnetic surface is different. It -should- work, but often a 720k floppy can't read the reformatted floppy because of these differences. I even ran into this problem on IBM clones.

Check your email.

Ken

3316. Feedback wanted for my website

Hi all!

Can someone give me some feedback on my new(ish) look of my Atari Downloads Page? http://jfhaslam.atari.org

I recently added some quick-indexes for each section and was hoping to get feedback from users.

Is the page easy to use for you? And is there anything missing that I should put on there?

Thanks in advance!

Cheers,

James

Hi, Lyle,

When Micro$loth released the first version of Win95, it had the same 16 bit file system as did DOS. So there was absolutely no problems reading the disks on either OS. But with SR2, you had the option of retaining the 16 bit file system or switching to the 32 bit system. The basic catch was the 32 bit filesystem was not compatible with files from the 16 bit system. The big advantage of the 32 bit system was the support for long filenames.

But M$ also realized there would be a lot of people transfering files via floppy between the old and new systems, so the basic floppy disk directory was left intact, but an additional file directory was added that could be read by the 32 bit system so long filenames were supported. Old systems read the old 8.3 filename, new systems the long filenames. When the M$ user saved using the long filename to floppy, a truncated 8.3 filemane was created in the old directory. That's why, in old programs that don't support long filemanes, you will see a file name with a tilde in it, such as XXXXXXX~.XXX.

On my TT running Geneva and Neodesk, when reading a Win98 formatted disk I get strange file names of A? with a filesize of 0 bytes. I can't deleted it, read it, do anything except see it in the fileselector. And every file write to the floppy under Win98 ads a new filename entry. But I've never had a problem transferring files, although I don't do it regularly. I use zip disks if I have a lot of files to transfer. Have you considered the option of a ZIP? I used to own a Stacy, but can't remember if it has a SCSI port or not.

As for transferring using a null modem cable, I would thing all you would need is the cable and terminal software on both machines. I did this years ago between my Atari 800 and Mega 4. Obviously, I didn't have software with the same name on both machines.

On the STacy I think Flash or STalker would work, and HyperTerminal on the MS se machine, assuming that program or some other type of terminal program is there by default. Of course, the trick will be learning how to use command line interface commands to make this work. STalker is GEM based, so you should be able to do the mouse thing there. The old copy of Flash that I had was all command line, I don't know about the last versions. HyperTerminal is definitely command line, and of course no manual is provided.

Are you truly confused now? :-)

Ken

Ok, before this spins hopelessly into f'd-upped land, I give up. You're right. Hell, booze, cigs, and betting ARE essentials. I mean, if you're on a deserted island with 50 crates of food and water, but no booze, cigs or a lottery ticket, you would surely perish!!

And as for the right to judge, I'm not judging, I'm just stating that although you might think they are essentials, they are not essential to SURVIVAL...

BUT, as I said before, I'm done with this thread. later...

Well the null modem cable sounds like a good idea, but I won't be able to
install a copy of STalker until I can share disks w/ the PC!

I used to get Sony brand pre-formatted disks and they worked very well.
sigh Thanks for all the help anyway, folks.

BTW, I double-checked my Stacy's A:\ drive and it's reading my old Atari disks just fine.

Would a CD-ROM drive solve the problem?

STalker is a commercial product, so I don't understand why you need to share disks before installing it.

I don't know if the version is written on the chips.
But I wrote a little utility that will determine the version TOS you are
using.
Goto http://www.asmsoftware.de/, into the Atari ST section and get the tool
"Checktos".

cheers,
Matthias

nice one albeit a tad white around the edges :) and after getting spam
from folks who said that they got my address via a Guest Book, I never sign
in anymore

great work...I'm downloading Nethack

can anyone remember a game back yonder where at the start of the game , you had to crack the password to get in? I think the game was about hacking ? Anyone know about it, got a spare copy ?

cheers

Hi all, I have a copy of c-lab creator sotware (need a dongle though)
up on ebay.uk

Link is here....
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=23784&item=2536589989

In one of my other auctions, there is also an atari ST internal
programming book

I had similar problems trying with 4/5/8GB drives. AHDI is really old and not good for anything over 1GB I believe. You will have to try another solution, like SCSI-Tools or HDDRIVER.

I myself and trying to find a copy of HDDRIVER in the US.

That might have been a no-no back in the dark ages but its perfectly ok in the times of mains water and sewarage otherwise why would the system allow you to do it.

Hello everybody,

Romspeed is relotating the Tos in ram for TT, unfortunately it don't
work on Had�s.

Does anyone know a programm that would work on Had�s for the same purpose ?

Gemram16 runs on my computer even if I didn't notice any speed improvement
but moves only the Gem in ram.

Regards

M�gamodeste

I have done business with Paul quite a bit and experiences him as none other
than a courteous and reliable person. Sure, he was a bit slow at time
(sending stuff, I mean), but other than that I have nothing but good things
to say about him.
I entered this thread at the end so I don't know how he allegedly stole your
20 quid. Didn't the ST Club go broke or into receivership or something? When
that happens, customers often get duped, and that's usually because customers
and employers are last in line when it comes to payments. Usually the tax
collectors are first, and there's not a lot left after that.

These are the three standards used by USB:

- UHCI (Intel, VIA ...)
- OHCI (Compaq/Microsoft/National)
- EHCI (USB 2.0)

I tried looking for a EHCI - USB 2.0 card One of my local hardware suppliers:

http://www.scan.co.uk/products/iocard.htm

lists this as being "most compatible" having an NEC chipset:

http://web6.scan.co.uk/Products/Info.asp?WPID=18489

Unfortunately the Manufacturers website is Flash.

This D-link card might be an alternative:

http://www.dabs.com/products/prod-info3-info.asp?&m=y&quicklinx=MBD

I checked a very old book I have, by Katherine Peel,
"The Concise Atari ST 68000 Programmer's Reference Manual."

She gives the following (concise) advice, for reading the port:

a) Set PSG I/O B port to input
b) Switch strobe line off
c) Check busy line for high, loop until high
d) Switch strobe on
e) Get data from PSG's B ouput register

Good luck,

Steve.

Source record: 26879

As usual, I thought some more on this issue after posting...

Katherine's advice makes sense. If the strobe line on the
sending computer is connected to the receiving computer's
busy line, then we obviously have to wait for it to go high
before attempting to read the byte.

But I think she's wrong about handling the strobe line,
if strobe and busy are crossed over, that is.

I've been looking at some PC code I wrote to write to
the printer port. I notice that I wait until BUSY is
high before sending the byte.

Since BUSY seems to be active low, and you have
strobe on the receiving end connected to busy on
the sending end, your procedure to read one
character should be:-

1: set strobe high
> > ' ~XBIOS(30,strobe.bit%) !STROBE high

The sender sees this as 'not busy' and sends a byte by
writing a byte to it's output port and setting it's strobe high

2: Wait for your busy line to go high (strobe from the sender)
then read the byte and set your strobe to low to indicate that
you're busy.

Actually, you could probably just leave it high and be permanently
'not busy'. That's probably the purpose of that pull up resistor that
someone mentioned.

The important thing is that you *must* wait for the sender to
strobe before reading the byte.

If the sending computer expects proper handling of the
Acknowledge line, then I'd say it won't work with your
cable.

Steve.

I'm looking to upgrade a Mega STe with a FPU and
graphics card. Is there a socket on the motherboard
for a FPU on the Mega STe machines?

Also does anyone have a colour graphics card for
a Mega STe. Possibly to swap for a Falcon graphics
card?

Last but not least - I know the Mega STe can run
at 16MHz - how do you enable that as there doesnt
seem to be anything on the computer to select it
(the HD is blank except for AHDI)?

Cheers

Bob.

You're right-on, of course. The anon poster is obviously demented and in dire need of attention. He can't get it via his sub-Neanderthal personality, so he resorts to trolling in Usenet, in the hope that folks will pay attention to him at last. His true colors do shine through, however, in a number of ways. Consider his spelling and grammar atrocities - indicative of an early-high school dropout. I'd guess that he has a sever case of acne and wears ultra-thick glasses, his eyesight adverselt affected by extreme masturbation. And there is no doubt that mommy caught him yanking his crank more than once . . . perhaps even calling in the canasta group to witness her exasperated little boy sitting panting on the bathroom floor surrounded by muscle magazines. And consider his obsession with the gay life too . . . there's much more than meets the eye herein.

Some might pity the tyke, owing to the fact that his uncle/dad abuses him nightly, but I say to hell with him. The only reason to let him copntinue to breathe is for our amusement. Hence, consider him forthwith as your personal whipping boy. Scan each of his childish posts and use them to illustrate to others how a simpleton's intellect proved to be a total waste of sperm.

One more thought...

You mentioned interrupts in an earlier post.
The original ST handled the parallel port
by polling, not by use of an interrupt.

Does your ST use an interrupt on the parallel port?

If so, then this interrupt is for *sending* data.
What condition triggers the interrupt? It can't be
a high on the busy line, surely. The printer could
become 'not busy' at any time, even when you've
no data to send. Acknowledge, perhaps?
I don't know.

Anyway, if there's an interrupt enabled on your
printer port, it will be for *writing* data, not
for reading it. Such an interrupt might be interfering
with your attempts to read.

Steve.

AFAIK, Kenneth's assembler code is based on mine which enables the busy interrupt on the MFP. The routine I wrote sets STROBE low and waits for a busy interrupt. As soon as one is received, the interrupt routine sets STROBE high and reads the byte into a buffer. If there's space left in the buffer, it sets STROBE low again and goes back to waiting. To read from the buffer, I replaced the BCONIN, and BCONSTAT, code for the printer port so they either return the next byte from the buffer, or a value saying the buffer is empty or there's data available.

My latest code[0] has corrected a couple of errors that I hadn't seen while coding on an emulator but, after managing to get hold of an ST, tests on it showed them up clearly.

There are still some problems with it. I'm still trying to figure out why sometimes receiving data causes a crash (multiple tests showed the crash occurred anywhere between 1kb and 10kb), how to speed up the interrupt handling to capture all the inbound data, or why the ST thinks that an occasional byte coming in from the printer port is a key press.

From: mstepansky@aol.com
Message-ID: <20030606020742.04349.00000542@mb-m04.aol.com>
Source record: 26887

About Atari

New York-based Atari, Inc. (Nasdaq: ATAR) develops interactive games for all platforms and is one of the largest third-party publishers of interactive entertainment software in the U.S. The Company's 1,000+ titles include hard-core, genre-defining games such as Driver(TM), Enter the Matrix(TM), Neverwinter Nights(TM), Stuntman(TM), Test Drive(R), Unreal(R) Tournament 2003, and Unreal(R) Championship; and mass-market and children's games such as Backyard Sports(TM), Nickelodeon's Blue's Clues(TM) and Dora the Explorer(TM), Civilization(R), Dragon Ball Z(R) and RollerCoaster Tycoon(R). Atari, Inc. is a majority-owned subsidiary of France-based Infogrames Entertainment SA (Euronext 5257), the largest interactive games publisher in Europe. For more information, visit www.atari.com.

So, who owns Atari (the company who makes Atari XE/XL, ST, TT, Falcon)?

Mike

3356. Atari Falcon game titles - how many?

Newsgroup: comp.sys.atari.st
Date: 2003-06-06 06:10:49 UTC
From: mstepansky@aol.com
Message-ID: <20030606021049.04349.00000544@mb-m04.aol.com>

Approximately, how many game titles are there for the Falcon/030? How about for Falcon/040?

Where can I find a list of games for it? (web link)

Is it possible to find Falcon emulator for the PC? (I have seen STe emulator for the PC).

Mike

3357. Joypad recommendations for ST emulator?

Newsgroup: comp.sys.atari.st
Date: 2003-06-06 06:22:03 UTC
From: mstepansky@aol.com
Message-ID: <20030606022203.04349.00000545@mb-m04.aol.com>
Source record: 26889

I need a joypad (rather than flightsim-style joystick) to play games running in the ST emulator (Steem) on a PC. It is kinda hard to play with using PC keybd. I never had any joystick experience for any PC yet - let alone Atari ST.

I have seen a nice one like Saitek's P300 or P880 - metallic blue coverall, black rubber handle, silver-white buttons; 8-directional button + dual analog stick (ala Playstation joypad) + 4 buttons + 2 L/R trigger buttons. USB port (so you can plug and boom-ready to play). For $20. P300 is a wireless version.

http://images.google.com (keyword: Saitek joystick) - see it in the 5th row, first picture.

Any recommendations? Link helpful.

Mike

3358. Using Atari Classic CX-40 joystick for PC?

Newsgroup: comp.sys.atari.st
Date: 2003-06-06 06:27:52 UTC
From: mstepansky@aol.com
Message-ID: <20030606022752.04349.00000546@mb-m04.aol.com>
Source record: 26891

While I post the "Joypad recommendations" questions earlier, I am still wondering if anyone have built, converted or sell a working CX-40 joystick to be hooked up to a PC running Atari 2600 emulator or even ST emulator.

I understand that its serial port has 7pins versus the current 9pins in PC.

Anyone? I don't know how to built one - I need someone to built one so I can pay for it. I had someone who knew someone to make one but I lost that person.

Mike

Source record: 26892

Infogrames bought up all the rights and such from Hasbro, who got them from JTS, who "bought up" the Tramiel-era Atari Corp., which died from some crappy, bass-ackwards decisions made by the Tramiels... but JTS also bit the dust shortly thereafter...

Then, recently (about two or three weeks ago, if memory serves me right), Infogrames dropped a *HUGE* bombshell and renamed themselves "Atari, Inc."! Every division across the world! See for yourself!

So, in essence, Atari is BACK!

However, they only make software these days (since they just changed all the names, not the business practices).

I'd like to know if they still own the copyrights, case molds, registration cards, and such from the ST/Mega ST/STe/TT/Falcon030 computer era. And, if so, whether they have any willingness to sell or license them for the right price.

So far as I know (or have read), I think Milan now owns the rights to TOS/GEM for the Atari ST. The PC version of GEM was recently GPL'd.

Message-ID: <jWWDa.50440$1s1.671245@newsfeeds.bigpond.com>
Source record: 26893

I dug out my old 'ST Internals' and looked through
your code. I didn't check too many details, you
obviously know what you're doing.

I was a bit sleepy when I was posting earlier,
so I didn't notice that most of my points had
already been covered. I checked a printer
manual, and from the point of view of the printer,
STROBE, and ACK are all active low, and
BUSY is active high. On the PC, all three
signals are inverted.

On an ST, only strobe is inverted so both
look active high to the programmer.

Is Kenneth using an assembler program?
I only saw this GFA code, and I don't see how
it can work. There's no test of the BUSY (strobe)
line from the sender, either by interrupt or polling.
Or does INP(0) look after that?

```
DO
' ~XBIOS(29,NOT strobe.bit%) !STROBE low
' ~XBIOS(30,strobe.bit%) !STROBE high
PRINT INP(0);" ";
' PRINT CHR$(BIOS(2,0)); !Read from PRN
LOOP UNTIL INKEY$=" "
```

The correct procedure is exactly what you did
in your assembler program, though checking
the STROBE could be acheived by inefficient
polling...

Something like...

```
loop:
Set BUSY = low

wait for STROBE to go high

Set BUSY = high

read the byte

goto loop
```

Steve.

Bob,

I will swap one of 2 mega ste video cards I have for your falcon card
(what kind of card is it)?

I have an AlberTT which does 1024x768 in 16 colors. It's rather slow on
vdi_scroll

I have a Matrix Coco (I believe). Supposedly it does 1024x768x256 color
but it also has a humongous truecolor expansion board too. This board
needs fixing! I can't find information out there on how to rehook it back
together so it works. I haven't mustered the courage to try the card
without the truecolor board to see if it still works in 256 color mode.

PC.

You dont understand at all. The CX40 (and all other same era sticks are not a serial port joystick. There is no such thing. Joysticks were digital (before the STE and Jaguar got analog ports). You pressed a button or a direction and it just pulled that particular line in the socket to ground which told the computer that you moved the stick. Not how much, just that it had moved in that direction. The reason it has 9 pins and uses a D socket? Well they were invented before serial interfaces were standard. If you have been assuming that because a socket fits a plug it must be the same, then you must have blown up loads of shit in your house over the years.....

Its really simple to build this. I tried to explain it to you last time you were here (or was that on the http://www.atari.org forum) ? but you wouldnt have it.

Go buy any joypad that feels comfortable to you. If you are using Steem, and
its a Windows compatible pad, it will work.

about
> for Falcon/040?

There is no such thing as a Falcon 040. At least one never got made
commercially. There are however upgrade cards like the Afterburner which
includes a 68040 cpu, and there are several clones around that used either
the 68040 or the 68060. However it makes no difference to the amount of
games available, except by saying maybe not all games for the Falcon will
run on certain accelerators.

> Where can I find a list of games for it? (web link)

Cant remember. Try google. If you goto 1632systems.co.uk you can find a list
of Falcon/STE/ST games that are still for sale. If you want to purchase, you
can trust Nick he is one of the Good Guys.

> Is it possible to find Falcon emulator for the PC? (I have seen STe
emulator
> for the PC).

Not exactly, however there is an emulator project (no flames please) called
Aranym which uses/used the Falcon OS 4.04 although they are adamant it isnt
a Falcon emulator. I havent tried it for a long time so I cant say for sure
how advanced it has got. Goto http://aranym.sourceforge.net/ and see for
yourself.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!
http://www.aracnet.com/~atari/shipping.htm How I can save you Money!

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

I've been watching this "battle of viewpoints" for some time now. Seems to me we are just splitting hairs, and it all depends on the point of view.

Smeg and Luposian, this is not a personal reply to your comments, I just happened to pick this post to reply to. This post is just for the sake of discussion.

From the Smeg point of view, it seems that Atari would only be Atari if it was still an independent corporation and still making hardware. To begin with, a corporation is not truly independent as the organization does have people to answer to for their actions, those people being the shareholders and the Securities and Exchange Commision for example. Management cannot just do as they wish as if they were a one-man (one-person?? :-)) business. Which means most of the shares would be in the hands of the Tramiels, as I believe they were. But the feeling in the newsgroup that I pick up is decisions by the Tramiels is the main reason for the demise of the company.

From the Luposian point of view, it seems that as along as the name is out there making something computer and/or game product, they are back.

So I give to you the following things to consider in this debate:

1. Let's not forget that Atari started as a game manufactuerer, not a computer (as we now define a computer, having keyboard, monitor, printer, etc.) company. So you could take the point of view that Atari is back as the name is on the software being produced. (This is not the first time a successful company has purchased a dieing/dead company and all its holdings and used the better known name.) As a game manufacturer, the associated hardware, such as the 2600 game console, is no different than the first software company to write a flight simulator and produce a companion piece of hardware (aircraft control wheel) to sell with the software so you didn't have to use a joystick. So if you stopped making the game consoles but still produced games, do you no longer exist?

2. My name is Hudson, and I own the Hudson Motor Car Company. I've made cars (games) for 30+ years. I start a line of pickups (computers). For what ever the reason, the pickup, although well built and has ardent supporters, does not survive in the market place. I drop the computers and concentrate on games again (Jaguar and Lynx). Does this mean I'm no longer Hudson Motor Car? How many people here would say a Jeep is not a Jeep? Jeep was a product of Kaiser Corporation's auto production (Willys Overland and a couple of other cars). Hudson and Nash merged and became American Motors, who purchased Jeep. Is a Jeep no longer a Jeep? Then AMC is purchased lock, stock, and barrel by Chrysler. Is a Jeep still a Jeep? And now Chrysler has "merged" with Daimler-Benz. (There is the argument there as to who bought who.) Is a Jeep still a Jeep? (Another piece of auto trivia, Hudson's were the darlings of the stock car world in the late '40's and early '50's with factory available superchargers. They were also one of the best selling car lines.)

3. What if the Tramiels had come out with a line of toasters, blenders, and other kitchen appliances? Sold like wildfire, while the games/computer products lost market share and were dropped. Does Atari no longer exist?

My point is, for both groups, that to wish for what used to be is pointless. The world marches on and product/ownership/name relationships change. That is what happened with the Atari name. Will the name survive as a game maker, even though the current owners are not the original owners? Possibly. Will there ever be another computer with the name Atari on it? Highly doubtful. It would have to blow everyone else out of the water, be compatible with their programs, be cheap from the outset, and do something everyone wants but no othe manufacturer can do.

Just something to think about in your spare time. :-)

Ken

> Mike

Yes, the best gift that could be made to our shrinking Atari community would be the release of the TOS into the public domain. Who knows?

I just had a look to the Wizztronics pages, and they write black on white, that in 2001 they "gave" the TOS source to a third party, probably a single person, maybe an ex-employee of them.

The full text is to be found here :
http://www.wizztronics.com/Discontinued.htm

Another thing to consider, along these lines of thought, is that Atari of the late 70's and early 80's, under Nolan Bushnell, went bankrupt and was bought by the Tramiels. While they still made hardware that was similar to previous machines (8-bits), they only did so for a very short time, while at the same time creating a radically different machine (the ST). So which one is the "real" Atari? Our new Infogrames/Atari makes remakes of older software, while also creating radically different games. Couldn't this also be seen in a certain way as a continuation of the past Atari, similar to the Tramiel's (except on the software-only side)? Just a thought...

Anyway, I too would love to have the good old glory days of Atari back. But those days are over. Now we have a new Atari that at least recognizes on some level the greatness of the old Atari. We also have Atari clones and upgrades to our old machines still being developed, albeit under different names. But isn't that just an issue of label? As far as I'm concerned, if we can still get what we need for our machines, Atari is still around, if only in spirit. And hey, at least Infogrames/Atari uses the "real" Fuji symbol, where Hasbro/Atari used some botched-up imitator. No doubt Infogrames/Atari has *some* respect for the past. And wasn't Infogrames an Atari supporter when Atari was still it's old self? Better them having the name than a company who has never did anything for the old Atari. Again, just a thought...

Yup. As long as ATARI is making something. When Infogrames first bought up "Atari" (rights and IP and stuff), it was just a name slapped on the side of a box. It was not a company. It was only a brandname, seemingly being exploited for it's nostalgic vapors (which is all that Atari really has nowadays).

But then Infogrames, in a burst of ultimate glorious wisdom, CHANGED their entire frickin' wordwide name... *TO* Atari, Inc.!

"Atari" is no longer just a brand name... it is now a corporation... across the world!

Yes, it's *just* a name change, but... what a name to change to! It changes everything! Now there is, again, some potential, that with a little nudging and coaxing, perhaps somehow... some way... Atari hardware (game or computer) may be produced again. It's no longer just a brand name we're trying to resurrect into a company again, but a company we're trying to encourage to make hardware again! THEY have made our task significantly eaiser, all by a (simple?) name change!

piece of auto

> trivia, Hudson's were the darlings of the stock car world in the late
'40's and early
> '50's with factory available superchargers. They were also one of the
best selling car
> lines.)

In this analogy, your assessment is true, as long as a Jeep retains the meaning of what the name represents. In my mind, a Jeep is like the Renegade. It always will be. I thnk they still make them like that. But "Jeep" now makes somewhat different vehicles, thankfully not a redical departure from the original, to my knowledge.

Now if Jeep started making pickup trucks... and stopped making the vehicles that are or resemble (somewhat) the original Jeep, that'd be a big jump that could seriously affect mindshare of what "Jeep" means and makes, hampering sales drastically.

So, yes, as long as Jeep makes Jeeps and Jeep-alikes, then a Jeep is a Jeep is a Jeep, in my mind.

> 3. What if the Tramiels had come out with a line of toasters, blenders,
and other kitchen
> appliances? Sold like wildfire, while the games/computer products lost
market share and
> were dropped. Does Atari no longer exist?

Atari would still exist, but the radical departure (necessary or otherwise) could affect mindshare drastically, especially when "Atari" has meant gaming in software/hardware and later, computers. To me, "Atari" can only exist as a true entity of it's past heritage under the following conditions:

1) It exists as a physical business, not just a brandname.
2) It makes software and/or hardware.

Sure, "Atari" has always, but ALWAYS, made gaming hardware of one kind or another (arcade games, pinball machines, home consoles, and home computers), but they've also made sogftware.

So, for them to be making *ONLY* software today is not an impossible step for them (since Atari also did that in the past). It's just a difficult one to accept, since I loved the hardware so much.

Now if they started making toasters and refrigerators, and home appliances... you might have to pick me off the floor and bury me in a sound-proof coffin... 'cause I'd probably die from laughing... and keep laughing in my grave! :-D

> My point is, for both groups, that to wish for what used to be is
pointless. The world
> marches on and product/ownership/name relationships change. That is what

> the Atari name. Will the name survive as a game maker, even though the
current owners are

> not the original owners? Possibly.

Original owners? The only original owner was Bunnell... or whatever his name was... the guy who STARTED Atari! After that it was sold to Warner and to the Tramiels and then JTS and then Hasbro and then Infogrames. It's been handed down at LEAST five times! BUT! Between the creation of Atari and the Tramiel era, "Atari" has always made hardware. *That's* the hard pill to swallow. They don't anymore... and may never again...

> Will there ever be another computer with the name
> Atari on it? Highly doubtful. It would have to blow everyone else out of the water, be
> compatible with their programs, be cheap from the outset, and do something everyone wants
> but no othe manufacturer can do.

Or at least be vastly more powerful than anything bearing the Atari name (or association; i.e. "clones") currently, if you go with the "sell to the converts" ideology. If you "sell to the converts", you don't have to worry about being better than the outside world. You're in your own world and you make the people in your world happier by giving them a faster computer! As long as they don't make outside comparisons ("the PowerMacs are sooooo much slower than a Pentium4 (or AMD) 2.7GHz system, because the fastest PPC processor is only 1.2GHz!"), then there's no problem. I mean, any computer, that is 100MHz or greater is going to, most probably, dust any Atari or Atari clone right then and there... does it really matter that it's not faster than a modern PC/Mac? No, because it's NOT a modern PC/Mac... it's an Atari computer! It processes things faster and better than the models before it. And, in the World of Atari computers, that's what makes us happy!

If Atari, Inc., right today, made a 500Mhz PC, that ran a Unix-ish clone OS (*NOT LINUX!!!*) with a GEM-like interface, and had a handful of applications (perhaps even an emulator to run some Atari ST apps), games, and utilities... I would buy it in a heartbeat! As long as it set itself apart from "other PC's" by having an OS that wasn't just a common GUI atop of a common OS foundation (like NetBSD, OpenBSD, FreeBSD, any of the bazillion Linux variants, etc.), it would be worth owning. Afterall, if it's no different than any average PC running a commonly available OS/GUI, what makes it any different than a... well, you get the idea.

An Atari computer must NOT, under any circumstances, function exactly like (nor be entirely compatible with) a regular PC... even if the guts are the same on the inside and the peripherals are the same on the outside.

"So it is written, so let it be done..."

> Just something to think about in your spare time. :-)

I have waaaaaaay too much spare time to think about stuff like this... :-D

>Anyone know about it, got a spare copy ?

Hi, an 8 bit graphic adventure game if I remember called (surprise) Hacker.
My old brain is failing but If I remember right you type _anything_ at the
login, hit return and just let it run some rubbish past you before it sort of starts
the main game.
Try the comp.sys.atari.8bit forum for umm, helpful help.
Regards, Steve.

Very well said! The difference is similar from when the Atari 800 and Falcon030 were released, a radical difference. Completely different beasts, some can have said that the Falcon was not a Atari! The only difference now is more time has passed and no Computers are being sold. I mean try to realize how much technology has changed from games on the Atari ST to games today like Enter the Matrix? Atari was always a software company IMHO. It has just changed owners several times!

And do we really want a 2GHz TOS Compatable Computer to be released by Atari Inc? Not going to happen.

I'm sorry to hear that you've got problems getting the Yamaha doing it's thing
under MetaDOS and SPIN!, but don't generalise your problem. I have two Yamaha's
here (8824S & 2200S) and both are recognised and work perfectly with both
drivers. I'm not the odd one out because I know several people here who
use Yamaha writers with these drivers....
As for CD-Lab it's simple: if the drive is MMC-3 compatible *and* a SCSIDRV
driver is installed, it works. Nothing more, nothing less.

>and it's always turned out the same: they don't work and I am repeatedly
>recommended the Anodyne package instead. So personally I wouldn't say SPIN is
>the *most* versatile CD driver. It does nothing for me.

I didn't say that SPIN! is the most versatile one because I like it better,
all one needs to do is to look at the features... and let's keep things in
perspective: all the original poster wants to do is to rip audio tracks from
a CD, one doesn't need to spend money on a driver to accomplish this. MetaDOS
in combination with CD Player from A.Claus (both freeware) will take care of
it.

Cheers from Belgium
Dennis

Whatever, its not even relevant why they died, just that they did.

> From the Luposian point of view, it seems that as along as the name is out
there making
> something computer and/or game product, they are back.

Who is they? Infrogrammes have been here for years. Nothing has changed.

> So I give to you the following things to consider in this debate:
>

> 1. Let's not forget that Atari started as a game manufactuerer, not a
computer (as we now

Yeah. They innovated. Infrogrammes made some cool games aswell, but no where
near the genius of Atari.

> My point is, for both groups, that to wish for what used to be is

The point has been totally missed. Its not about thier games, or their hardware, not even the Tramiels, but its about the PEOPLE who made it all happen. The genius' that slaved day and night to invent and innovate, sacrificing home and family life to make dreams happen. The people that work at infrogrammes are not the people that worked at Atari. They have NOTHING to do with each other.

Official receivership should result in all concerned parties getting a
letter explaining the situation, even if bugger all else should follow.
Basically there was quite a long absence of the (bloody outstanding) mag
that was broken by a (iirc) a letter stating that the magazine needed some

loyal subscribers to re-sub to guarantee the mag would stay alive, that was some years ago, my cheque having long since been cashed.

He chose to ignore all methods of communication. from myself and others.

When ATARI died, it was when the Tramiels sold it to JTS. All of the people, the assets and the intellectual rights got effectively thrown in the trash. What happened after JTS isnt even relevant, seeing as it was just brand name transfer anyway.

> > Will there ever be another computer with the name

Hi Edward etc

>>I have been trying to activate Long Filenames on a number of hard disk
>>partitions (7), so far without any success!
>>
SUCCESS!
>>Partitions I to O are larger than 2.0Gb each, they are of type BGM in
>>HDDRIVER and they are recognised (ie openable) in Magic v6.20/jinnee.
>I
>>have put in my MAGX.INF "#[vfat]
>drives=ijklmno".
This I thought would be enough, but it seems when I ran VFAT.PRG drives i-
o were not highlighted as being Permanently VFAT drives! So after
setting all the partitions back to BGM in HDDriver, I chose and set these
drives up. I ran the Magic Config utility just to make sure, it seemed
to think there was a problem with the MAGX.INF file which I find hard to
believe.

Hey presto! When I next booted up all the partitions showed up on the
desktop. I used UnZip to de-archive the MagXNet distribution (which I
knew requires a LFN drive) and as soon as I saw the small letters I knew
it was successful...!

>>

Still don't get why you need to use F32 when BGM seems to work perfectly!

>Hmmm??? Strange. I have gotten the LFN to work on my 1meg Jaz

>to work.
That was probably the answer then! Using an editor to add the #vfat
lines wasn't enough.

Thanks

Neil :-)

PS Now for getting hold of the Iconnect Gateway! Does anyone have
Vassilis's email address?

3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14Mb/1Gig/CD
Falcon 030 MkX CT2B 50MHz/78Mb/20Gig/CDRW

Not to endanger your health, but you do know that that was one of
Jack Tramiel's intentions...?

They actually started a division that was going to produce "Atari
Telecommunications" equipment (telephones), and they were planning a
"consumer appliances" division, although they were never too specific
about what exactly that division was going to produce.

Atari toasters WERE mentioned...

(This was right around the time the Atari Calculators were taking the
world by storm.)

The guy had some pretty weird ideas. No wonder the company went into
the toilet.

Steve,

You used to complain about ppl not quoting good enough, resulting in
too many Kb's for you to download. Have you got any good excuse why you
can abuse usenet like this? Send it in private mail, or don't send it.

Cut it out.

/Joakim

Neil,
Try papval@otenet.gr If that does not work let me
know and I can e-mail you the latest MagicNet with
Iconnect gateway. He ussually gets back with people
who e-mail him.

Thanks,
Carey Christenson
